Hot soak results are scaled to reflect zero emissions for trip lengths of less than  
5 minutes (about 25% of in-use trips).

Title : South Coast Air Basin Subarea Winter CYr 2030 Default Title  
Version : Emfac2007 V2.3 Nov 1 2006  
Run Date : 2010/04/05 15:57:26  
Scen Year: 2030 -- All model years in the range 1986 to 2030 selected  
Season : Winter  
Area : Riverside (SC)

\*\*\*\*\*

Year: 2030 -- Model Years 1986 to 2030 Inclusive -- Winter  
Emfac2007 Emission Factors: V2.3 Nov 1 2006

(SC)      Riverside (SC)      Riverside (SC)      Riverside

Table 2: Starting Emissions (grams/trip)

Pollutant Name: Reactive Org Gases      Temperature: 70F    Relative Humidity: ALL

## CERTIFICATION

CERTIFICATION: *"I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this biological evaluation, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief. Fieldwork conducted for this assessment was performed by me or under my direct supervision. I certify that I have not signed a non-disclosure or consultant confidentiality agreement with the project applicant or applicant's representative and that I have no financial interest in the project."*

# 1 Executive Summary

Tom Dodson and Associates (TDA) has prepared this report to relay their findings of an assessment of biological resources and potential biological constraints associated with the Southwest industrial Park (SWIP) Specific Plan Amendment for the City of Fontana. The SWIP Specific Plan was adopted to develop the City of Fontana's industrial uses south of the I-10 Freeway. It is located within Township 1 South, Range 6 West, Sections 22-27 of the USGS – Fontana and Section 27 of the Guasti Quadrangles, 7.5 Minute Series topographic maps. The study area of the SWIP Specific Plan amendment is located north of Jurupa Avenue, west of Citrus Avenue, south of Valley Boulevard and east of Mulberry Avenue. The existing SWIP area encompasses 1,843 acres. The proposed additional areas include approximately 1,318 acres. The vast majority of land use within the study area is industrial. However, a few vacant lots and residential housing exist within the study area. The purpose of the proposed SWIP Specific Plan amendment is increase and maximize industrial development in the area. At this time, many of the parcels in the study area are considered to be underutilized.

For the general biological assessment and constraints analysis a California Natural Diversity Database (CNDDDB) search was completed for the USGS – Fontana and Guasti Quadrangles, 7.5 Minute Series (topographic). According to the CNDDDB, 29 sensitive species have been documented within these two USGS Quadrangles and of the 29 sensitive species identified for the two quads, six (6) sensitive species have a potential to occur in the vicinity of the study area. The species of special status identified to have a potential to occur within the vicinity of the project area include burrowing owl (*Athene cunicularia*), northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*), western mastiff bat (*Eumops perotis californicus*), western yellow bat (*Lasiurus xanthinus*), San Diego desert woodrat (*Neotoma lepida intermedia*), and Delhi Sands flower-loving fly (DSF) (*Rhaphiomidas terminatus abdominalis*).

After examining the background information sources TDA biologist, Shay Lawrey, conducted a pedestrian and windshield habitat assessment and general biological survey of the project area on October 23 and 24, 2008. The survey concluded that the habitat within and adjacent to the study area is highly disturbed and devoid sensitive habitat types or communities.

No sensitive plant or animal species are known or suspected to occur on or near the site. No part of the project falls within designated critical habitat for the federally listed endangered San Bernardino kangaroo rat or California gnatcatcher. Designated critical habitat for the federally listed endangered Delhi Sands flower-loving fly occurs adjacent to and within a small section of the project study area, between Almond Avenue and Live Oak avenue, north of Jurupa Avenue. No aspects of the Specific Plan amendment or annexation will result in direct impacts to Delhi Sands flower-loving fly, or their critical habitat. However, site specific evaluations will be necessary prior to the approval of site specific development projects within the SWIP boundaries.

Potential biological constraints to site specific development within the study area may include raptor, bat, and DSF habitat and regulated waters. Within the study area, there are small stands of eucalyptus trees which may provide suitable nesting, roosting and foraging habitat for various bat and raptor species. The few patches of open ground may provide suitable habitat

for burrowing owl, San Diego Pocket mouse, and/or DSF. It is not known if any of the parcels planned to be annexed into the SWIP Specific Plan contain any streambed, wetland, riparian, or Delhi Sands habitat types. Therefore, once site specific development projects move towards approval, site specific evaluations for burrowing owl, DSF and/or jurisdictional waters may be warranted and/or required. These potential biological resources do not pose a constraint to amending the Specific plan or to annexation of additional acreage, but they may pose a constraint on the future development of specific areas within the study area.

## **2 Biological Regulatory Setting**

### **2.1 Endangered Species Act**

Special status species are native species that have been afforded special legal or management protection because of concern for their continued existence. There are several categories of protection at both federal and state levels, depending on the magnitude of threat to the continued existence and existing knowledge of population levels. The U.S. Fish and Wildlife Service (USFWS) administers the federal Endangered Species Act (ESA) of 1973. The ESA provides a legal mechanism for listing species as either threatened or endangered, and a process of protection for those species listed. Section 9 of the ESA prohibits "take" of threatened or endangered species. The term "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in such conduct. "Take" can include adverse modification of habitats used by a threatened or endangered species during any portion of its life history. Under the regulations of the ESA, the USFWS may authorize "take" when it is incidental to, but not the purpose of, an otherwise lawful act. Take authorization can be obtained under Section 7 or Section 10 of the ESA.

### **2.2 Migratory Bird Treaty Act**

The Migratory Bird Treaty Act protects all native breeding birds, whether or not they are considered sensitive by resource agencies.

### **2.3 California Endangered Species Act**

The California Department of Fish and Game (CDFG) administers the state Endangered Species Act. The State of California considers an endangered species one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management and a rare species is one present in such small numbers throughout its range that it may become endangered if its present environment worsens. Rare species applies to California native plants. Further, all raptors and their nests are protected under '3503.5 of the California Fish and Game Code. Species that are California fully protected include those protected by special legislation for various reasons, such as the California condor. Species of Special Concern is an informal designation used by CDFG for some declining wildlife species that are not proposed for listing as threatened or endangered, such as the burrowing owl. This designation does not provide legal protection, but signifies that these species are recognized as sensitive by CDFG.

### **3 Jurisdictional Waters Regulatory Setting**

#### **3.1 Army Corps of Engineers**

The ACOE regulates discharges of dredged or fill material into *waters of the United States*. These *waters* include wetlands and non-wetland bodies of water that meet specific criteria. The ACOE regulatory jurisdiction pursuant to Section 404 of the Federal Clean Water Act (CWA) is founded on a connection, or *nexus*, between the water body in question and interstate commerce. This connection may be direct, through a tributary system linking a stream channel with traditional navigable waters used in interstate or foreign commerce, or may be indirect, through a nexus identified in the ACOE regulations.

#### **3.2 Regional Water Quality Control Board**

The RWQCB's regulatory jurisdiction is pursuant to Section 401 of the Federal CWA. The RWQCB typically regulates discharges of dredged or fill material into *waters of the United States*, however they also have regulatory authority over waste discharges into Waters of the State, which may be isolated, under the Porter-Cologne Water Quality Control Act issued by the State Water Resources Board.

#### **3.3 California Department of Fish and Game**

The CDFG, through provisions of the California Fish and Game Code (Sections 1601-1603), is empowered to issue agreements for any alteration of a river, stream, or lake where fish or wildlife resources may be adversely affected. Streams (and rivers) are defined by the presence of a channel bed and banks, and at least an intermittent flow of water. The CDFG typically extends the limits of their jurisdiction laterally beyond the channel banks for streams that support riparian vegetation. In these situations the outer edge of the riparian vegetation is generally used as the lateral extent of the stream and CDFG jurisdiction.

CDFG regulates wetland areas only to the extent that those wetlands are a part of a river, stream, or lake as defined by CDFG. While seasonal ponds are within the CDFG definition of wetlands, they are not part of a river, stream, or lake, and may, or may not, be subject to the jurisdiction of CDFG under Sections 1601-1603 of the Fish and Game Code.

### **4 Methodology**

Prior to conducting a field survey, the California Natural Diversity Data Base (CNDDB) and literature references were examined to obtain information on species occurrences in the project vicinity. A CNDDB search was completed for the USGS – Fontana and Guasti Quadrangles, 7.5 Minute Series (topographic). After examining the background information sources TDA biologist, Shay Lawrey, conducted a pedestrian and windshield habitat assessment and general biological survey of the project area on October 23 and 24, 2008. Photos were taken to characterize habitat conditions. Disturbance characteristics and animal species were recorded.

## 5 Results

According to the CNDDDB, 29 sensitive species have been documented within these two USGS Quadrangles and of the 29 sensitive species identified for the two quads, six (6) sensitive species have a potential to occur in the vicinity of the study area. Please refer to Table 1 for a complete list of the species occurrence potential on the property. The table includes the habitat requirements of each species and the potential of their occurrence on the site. The occurrence potential is based on site conditions and species range.

Currently, there are small patches of habitat, within the study area, marginally suitable for six (6) of the 29 sensitive species identified for the two quads. The species of special status identified to have a potential to occur within the vicinity of the project area include burrowing owl (*A. cunicularia*), northwestern San Diego pocket mouse (*C. fallax fallax*), western mastiff bat (*E. perotis californicus*), western yellow bat (*L. xanthinus*), San Diego desert woodrat (*N. lepida intermedia*), and Delhi Sands flower-loving fly (DSF) (*R. terminatus abdominalis*).

Some of the more common bird species found on site are the Greater roadrunner (*Geococcyx californianus*), brown-headed cowbird (*Molothrus ater*), Anna's hummingbird (*Calypte anna*), black phoebe (*Sayornis nigricans*), mourning dove (*Zenaida macroura*), house finch (*Carpodacus mexicanus*), and red-tailed hawk (*Buteo jamaicensis*). Mammal species that utilize the project site include, California ground squirrel (*Spermophilus beechyi*), cotton-tail rabbit (*Sylvilagus audubonii*), coyote (*Canis latrans*), and domestic dogs (*Canis lupis familiaris*). Common reptile species include, western fence lizard (*Sceloporus occidentalis*), and side-blotched lizard (*Uta stansburiana*).

The study area is designated for urban development (industrial). This is primarily due to existing land uses and the sites proximity to transportation corridors (I-10 Freeway, Southern Pacific Railroad, truck routes, etc.). The study area is located within a completely urbanized setting. The site is surrounded by urban development (paved roads, industrial, commercial and residential development, and freeway). No native vegetation or habitat exists on or near the project site. The land within the entirety of the study area is considered disturbed. There are existing industrial complexes, storage lots, residential housing and vacant lots. Weed abatement activities occur in all areas containing open ground as required by the City/County Code Enforcement.

The project does not occur within areas that are designated as unique or prime farmland under Williamson Act control, coastal zone, or containing wild or scenic rivers. No sensitive plant or animal species are known or suspected to occur on or near the site. Figure 9-3 of the City's General Plan indicates that no known natural biotic communities exist on or near the project site. Figure 9-4 of the City's General Plan indicates that potential habitat for sensitive wildlife resources, specifically for DSF occurs in the study area. Due to the urbanized nature of the area, no migratory corridors exist or will be affected by the proposed project. No part of the project falls within designated critical habitat for the federally listed as endangered San Bernardino kangaroo rat or California gnatcatcher. Designated critical habitat for the federally listed endangered DSF occurs adjacent to and within a small section of the project study area, between Almond Avenue and Live Oak avenue, north of Jurupa Avenue. No aspects of the

Specific Plan amendment or annexation will result in direct impacts to DSF or their critical habitat. However, site specific evaluations will be necessary prior to the approval of site specific development projects within the SWIP boundaries.

## **6 Potential Species of Concern Background Information**

### **6.1 Delhi Sands flower-loving fly**

The DSF is a mydid fly in the genus *Rhaphiomidas*, and the only fly presently on the Endangered Species List. This subspecies is restricted to the Delhi Sands formation, an area of ancient inland dunes of which only a few hundred acres out of more than 40 square miles (100 km<sup>2</sup>) remain, the rest largely now forming much or all of the foundation on which the towns of Colton, Fontana, and Ontario, California are built. The adults are only active for a few weeks each year, feeding on flowers, in August and September. Almost nothing is known about their biology, though early instar larvae appear to be attractive to ants, and are brought into the ant nest (it therefore seems likely that the larvae are predators of the ant brood).

This fly was emergency-listed by the United States Fish and Wildlife Service in 1993, and it has been an extremely contentious listing ever since. Political officials and news services from the region have repeatedly decried this fly as a disease-carrying pest, despite documentation that it is not; there have been repeated attempts by local officials to have the species de-listed. Residential and commercial development, agricultural conversion, sand mining, invasion by exotic species, dumping of cow manure and trash, and off-road vehicle use have resulted in significant loss and modification of the species' habitat. Estimates are that over 97% of the original habitat is already gone, and only a portion of what remains is suitable habitat for these flies.

There are an estimated 5-10 more species of insects endemic to the Delhi Sands formation, including newly-discovered and still unnamed species of scarab beetle, sand roach, and Jerusalem cricket

### **6.2 Burrowing owl**

Burrowing owls are a small ground-dwelling owl with a round head and no ear tufts. They have white eyebrows, yellow eyes, and long legs. The Owl is sandy colored on the head, back, and upperparts of the wings and white-to-cream with barring on the breast and belly and a prominent white chin stripe. They have a rounded head, and yellow eyes with white eyebrows. The young are brown on the head, back, and wings with a white belly and chest. They molt into an adult-like plumage during their first summer. Burrowing Owls are comparatively easy to see because they are often active in daylight, and are surprisingly bold and approachable.

The burrowing owl occurs in shortgrass prairies, grasslands, lowland scrub, agricultural lands (particularly rangelands), prairies, coastal dunes, desert floors, and some artificial, open areas as a year-long resident (Haug, et al. 1993). They may also use golf courses, cemeteries, road allowances within cities, airports, vacant lots in residential areas and university campuses, fairgrounds, abandoned buildings, and irrigation ditches (Haug, et al. 1993; Hayworth 1990 pers. obs.). They may also occur in forb and open shrub stages of pinyon-juniper and

ponderosa pine habitats (Zeiner, et al. 1990). As a critical habitat feature need, they require the use of rodent or other burrows for roosting and nesting cover. They may also dig their own burrow in soft, friable soil (as found in Florida) and may also use pipes, culverts, and nest boxes where burrows are scarce (Robertson 1929). The mammal burrows are modified and enlarged. One burrow is typically selected for use as the nest, however, satellite burrows are usually found within the immediate vicinity of the nest burrow within the defended territory of the owl.

The burrowing owl is a crepuscular hunter with a prey base including invertebrates and small vertebrates (Thomsen 1971). They typically forage in short-grass, mowed, or overgrazed pasture, golf courses and airports (Thomsen 1971). They are a relatively opportunistic forager (Haug, et al. 1993). Their diet is composed of a variety of foods included *Peromyscus*, *Microtus* and beetles. Beetles occur within their diet with more frequency, however, based on biomass, *Peromyscus* is dominant with *Microtus* appearing second in overall biomass (Marti 1974). Although they eat mostly insects and small mammals, they also may take reptiles, birds, and carrion.

Predators of burrowing owl include prairie falcons, red-tailed hawks, Swainson's hawks, ferruginous hawks, northern harriers, golden eagles, foxes, coyotes, and domestic dogs and cats (Martin 1973). The threats to the burrowing owl include conversion of grassland to agriculture, other habitat destruction, predators, collisions with vehicles, and pesticides/poisoning of ground squirrels (Grinnell and Miller 1944, Zarn 1974, Remsen 1978). Urban sites can act as unintentional preserves and support owl populations if habitat features necessary for owls are provided. This is supported by the documented population at Moffett Field in Santa Clara County California. The population has established itself and is using nest burrows under cement or other hard surfaces. The adult density, number of young fledged or pairs with emergent young is not different at Moffett Field compared to other intentional preserve areas (Trulio 1997).

### **6.3 Northwestern San Diego pocket mouse**

Northwestern pocket mice are moderately sized pocket mice, ranging in length from 170 to 200 mm and weighing from 17 to 22 grams. There is very little difference in size between males and females. Both are colored a dark brown on top and white underneath, with spines that are black on the rump and white on the hips. The northwestern San Diego pocket mouse inhabits coastal sage scrub, sage scrub/grassland ecotones, and chaparral communities. It inhabits open, sandy areas of both the Upper and Lower Sonoran life-zones of southwestern California and northern Baja California (in McClenaghan 1983). Bleich (1973) recorded the highest populations of the San Diego pocket mouse in coastal sage scrub supporting a mixture of coastal sagebrush (*Artemisia californica*) and California buckwheat (*Eriogonum fasciculatum*) on the Naval Weapons Station, Fallbrook Annex in northwestern San Diego County, but it was also relatively abundant in chaparral. The San Diego pocket mouse generally exhibits a strong microhabitat affinity for moderately gravelly and rocky substrates (Bleich 1973; Price and Waser 1984), and, to a lesser extent, shrubby areas (MWD and RCHCA 1995). In western Riverside County, the San Diego pocket mouse also commonly is found in disturbed grassland and open sage scrub vegetation with sandy-loam to loam soils.

Marginal records for the northwestern San Diego pocket mouse include Claremont; San Bernardino; Banning; and Jacumba (Hall 1981), and San Jacinto Lake, Riverside County (Mearns 1901). The northwestern San Diego pocket mouse occurs throughout western Riverside County and has been collected at elevations from 138 meters (452 ft) at Palm Springs, Riverside County, to 1,835 meters (6,018 ft) on the northern slopes of the San Bernardino Mountains in San Bernardino County (Lackey 1996). It is uncertain where the boundary between the northwestern San Diego pocket mouse and the pallid San Diego pocket mouse (*C. f. pallidus*) lies. The pallid San Diego pocket mouse occurs on the eastern slopes of the Peninsular Ranges in eastern Riverside County, but occurs in the transitional Cabazon area of Riverside County and the San Felipe Valley in San Diego County (Hall 1981). A transition zone between the two subspecies may occur in the eastern portion of the Anza or Terwilliger valleys or more to the east in the Santa Rosa Mountains.

Arid grassland and desert environments support a surprising diversity of coexisting rodent granivores. Pocket mice and other heteromyid rodents also modify their environments (Brown and Harney 1993; Price and Jenkins 1986). They dig burrows, which moves the soils and provides habitat and refugia for other species, including other rodents, reptiles, amphibians, birds and invertebrates. Collection, storage and consumption of seeds by kangaroo rats, for example, have profound effects on the vegetation structure of the habitats they occupy (Price and Jenkins 1986). In addition, resource use by pocket mice and kangaroo rats substantially overlaps with that of seed-eating birds and harvester ants. The San Diego pocket mouse appears to be sensitive to habitat fragmentation and degradation. Bolger et al. (1997) studied rodent diversity and abundance in isolated habitat fragments of varying size and age in San Diego County. The San Diego pocket mouse tended to occur in habitat patches with 90-100 percent shrub cover, with only two of eight occupied patches having shrub cover of 50 percent and 75 percent. Bolger et al. tentatively concluded that canyon fragments under 25 ha (61.8 acres) and isolated for more than 30 years support few populations of native rodents, including the San Diego pocket mouse. Their data also suggest that isolated habitat patches must be at least 25 ha (62 acres) to 80 ha (198 acres) to sustain native rodent populations. This species is still relatively common in sage scrub, chaparral, and grassland habitats.

#### **6.4 Western Mastiff Bat**

The western Mastiff Bat is the biggest North American bat, with a body length of 5.5 to 7.5" and a wingspan of over 22". Fur is dark brown, kind of thin, hairs white at base. Has huge ears, joined at base and extending out over forehead like a bonnet. They occur in two populations. One population is from the southwestern United States to central Mexico and the second is located in the central and northern portions of South America (Harvey and other 1999). The western or California mastiff bat subspecies is primarily known from low to mid-elevations in southern and central California southeast to Texas and south to central Mexico (Best and others 1996). There are isolated records of the species occurring in northern California, and few records east of the Sierra crest (Philpott 1997). Recent surveys in California (Brown report for West Mohave Plan Area) have shown that western mastiff bats are "more widely distributed than was previously realized" and significant populations occur in areas for which only single or scattered records were previously available.

Western mastiff bat is found in desert scrub, chaparral, mixed conifer forest, giant sequoia forests, and montane meadows (Philpott 1997). In the southwestern United States, this species is most often associated with upper and lower Sonoran life zones (Best and others 1996, Krutzsch 1943). In southern California, most western mastiff bat roosts are found in semiarid areas with low-growing chaparral (Best and others 1996) that do not significantly obstruct rock cliffs or outcrops. Because of its large wingspan, the western mastiff bat requires roosts that have at least 6.5 feet (2 meters) of free space to drop from to initiate flight. In the southwestern United States, day roosts are generally found in areas with rugged, rocky canyons and cliffs (Best and others 1996). Crevices in granitic rocks and consolidated sandstone are a common roosting substrate (Best and others 1996). These bats will also roost in building crevices—as nearly as many day roosts are known in buildings as in natural crevices (Barbour and Davis 1969). They are found in cities such as Tucson and Los Angeles (Best and others 1996). It requires large bodies of flat water for drinking sites. Its long, narrow wings preclude it from drinking at ponds less than 100 feet long (Bat Conservation International 2002).

Western mastiff bats are insectivorous and feed primarily on moths (Philpott 1997). They forage in broad open areas including dry desert washes, flood plains, chaparral, oak woodland, open ponderosa pine forest, grassland, montane meadows, and agricultural areas. They generally forage high above the ground (Bat Conservation International 2002), and have been recorded to feed on insects carried by air currents to altitudes higher than 1,000 feet (304.8 meters) (Best and others 1996, Vaughan 1959). Western mastiff bats utilize large pools with open space for approach (Best and others 1996) and are generally not netted over small ponds where other bats are frequently found (Best and others 1996). They may forage 6–15 miles (10–25 km) away from roost sites (Vaughan 1959).

## **6.5 Western yellow bat**

The western yellow bat can be distinguished from other bat species by the combination of yellow coloration, size (forearm = 42-50 mm), and short ears. Sexual dimorphism in size exists, with females averaging 2mm longer in forearm length than males.

They were formerly considered conspecific with the southern yellow bat, but currently considered a distinct species, *Lasiurus xanthinus* occurs in northern Mexico, western Arizona, southern California, southern Nevada, and southwestern New Mexico. Western yellow bats are associated with dry, thorny vegetation on the Mexican Plateau, and are found in desert regions of the southwestern United States, where they show a particular association with palms and other desert riparian habitats. They are known to occur in a number of palm oases, but are also believed to be expanding their range with the increased usage of ornamental palms in landscaping. *L. xanthinus* occurs up to ca. 2,000 m. in the mountains in Arizona.

Yellow bats are suspected to be non-colonial. Individuals usually roost in trees, hanging from the underside of a leaf. They are commonly found in the southwestern U.S. roosting in the skirt of dead fronds in both native and non-native palm trees, and have also been documented roosting in cottonwood trees. At least some individuals or populations may be migratory, although some individuals appear to be present year-round, even in the northernmost portion of

their range. Yellow bats probably do not hibernate; activity has been observed year-round in both the southern and northern portions of their range.

Yellow bats are insectivorous. Analysis of fecal samples of western yellow bats indicate their diet includes Coleoptera, Diptera, Hemiptera, Homoptera, Lepidoptera, and Orthoptera. Capture sites are often associated with natural and non-natural water features in open grassy areas and scrub, as well as canyon and riparian situations. Captures are also reported over swimming pools, lawns in residential areas, and orchards. In the U.S., pregnant females are known from late April through June, with lactation occurring during June and July. The number of embryos carried by pregnant females varies from one to four. Predators include barn owls, domestic dogs and domestic cats.

Few threats to the survival of yellow bats have been reported. Probably one of the primary threats in the U.S., however, is the cosmetic trimming of palm fronds. The use of pesticides in date-palm and other orchards may also constitute a threat to both roosting bats and the insects upon which they forage. Domestic cats, whether pets or feral, may be a substantial source of predation, as they are for many lizards, songbirds, and rodents.

## **6.6 San Diego desert woodrat**

The San Diego desert woodrat has a compact body, long tail, large ears, and large, slightly bulging, black eyes. Their feet are strongly built for grasping. Desert woodrats are a pale to dark gray washed with yellow above, light undersides, grayish to yellowish below, and gray at the base of the throat region. Hair bases are slate gray. Their tail, over half of the body length, is distinctively bicolored. Their hind feet are white. Desert woodrats are 22-38 cm (9-15 in) long with a 9.5-18 cm (3.75-7.25 in) long tail. They weigh 109-136 gm (4-4.75 oz). These woodrats live in high desert areas, chaparral, sagebrush flats, pinyon-juniper pine, and desert trees such as catclaw and Joshua (yucca).

Desert woodrats usually feed at night and are primarily herbivores. In their desert habitats their diet consists of spiny cactus, yucca pods, creosote bush, cholla, pinyon nuts, seeds, prickly pear, and any available green vegetation. This species does not drink water. Instead water is obtained from the instead getting it from succulent, moisture-containing plants in the diet of the desert woodrat.

Woodrats are commonly called “pack rats” because they have a tendency to collect any curious object they find, especially those that are small, bright, and shiny, and “pack” them back to their house or den. Should they find something more interesting, the first treasure is dropped to pick up the new one. Some objects are used in the construction of their houses to add strength and some are either deposited inside or at the entrance. In the desert houses are often constructed in or around cactus with cholla and beavertail cactus pads and spines used in the construction plus the collected man-made debris. The entrance is often fortified with cactus spines. A nest is constructed inside the house. These shelters help to make the nest cooler in the hot summer and to retain the woodrat’s body heat in the desert’s cold winter. They also provide protection from most predators.

## 7 Conclusions

Potential biological constraints to site specific development within the study area may include raptor, bat, and DSF habitat and regulated waters. Within the study area, there are small stands of eucalyptus trees which may provide suitable nesting, roosting and foraging habitat for various bat and raptor species. The few patches of open ground may provide suitable habitat for burrowing owl, San Diego Pocket mouse, and/or DSF. It is not known if any of the parcels planned to be annexed into the SWIP Specific Plan contain any streambed, wetland, riparian, or Delhi Sands habitat types. Therefore, once site specific development projects move towards approval, site specific evaluations for burrowing owl, DSF and/or jurisdictional waters may be warranted and/or required. These potential biological resources do not pose a constraint to amending the Specific plan or to annexation of additional acreage, but they may pose a constraint on the future development of specific properties within the study area.

Any future land disturbances for site specific developments within the study area should be conducted outside of the State identified raptor (February 15 through July 31) and bird (March 15 through September 1) nesting seasons. Alternatively, the site would need to be evaluated by a qualified biologist to determine if raptors or birds were nesting in the shrubs or trees to be removed prior to initiation of ground disturbance. Similarly, impacts to trees have a limited potential to impact roosting bats, should any occur. Trees scheduled for removal should be evaluated by a biologist for roosting bats, and if a roost is present the biologist should develop a plan to minimize impacts to the bats to the greatest extent feasible.

The project proponent is hereby informed that in the event that a listed species is observed within the construction areas prior to or during grading/construction, that the loss of any listed species is considered an illegal take under both state and federal law. This report and recommendations do not constitute authorization for incidental take of state or federally listed endangered, threatened or sensitive species or for state regulated bird nests or state or locally regulated plant species.

## FIGURES

The map displays the SWIP Project area, which is highlighted by a dashed rectangular box. This area is located in the central part of the map, near the intersection of the San Bernardino Freeway (SR 15) and the San Diego Freeway (SR 52). The project area is situated between the cities of Fontana and Rialto. The map shows a network of major highways, including SR 15, SR 52, SR 78, and SR 94. Other labeled locations include San Bernardino, Fontana, Rialto, San Diego, and various reservoirs and parks. The map also shows the San Gabriel River, San Diego River, and Lake Mead. The project area is located in the central part of the map, near the intersection of the San Bernardino Freeway (SR 15) and the San Diego Freeway (SR 52).

Re: Historical / Archaeological Resources Records Search  
Southwest Industrial Park Specific Plan Amendment  
City of Fontana, San Bernardino County, California  
CRM TECH Contract #2282

Dear Mr. Pfannenstiel:

At your request, CRM TECH has completed a historical / archaeological resources records search for the project referenced above. The purpose of the records search is to assist your firm and the lead agency for the project, namely the City of Fontana, in determining whether any potential "historical resources," as defined by the California Environmental Quality Act (CEQA), were previously identified within the project area (Fig. 1), and in assessing the project area's sensitivity for as-yet unrecorded historical / archaeological sites.

Since the project area is located near the Riverside-San Bernardino county line, the records search was conducted at both the Eastern Information Center (EIC) and the Archaeological Information Center (AIC). The EIC, located on the campus of the University of California, Riverside, is the State of California's official cultural resource records repository for Riverside County, while the AIC, located at the San Bernardino County Museum, Redlands, is its counterpart for San Bernardino County. The records search was conducted at the AIC on October 9, 2008, and at the EIC on October 10. Sources consulted during the records search include listings of California Historical Landmarks, Points of Historical Interest, and San Bernardino / Riverside County Landmarks, as well as the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

According to the records research results, since 1976 more than 20 previous cultural resources studies have occurred on small portions of the project area (Fig. 2), four of which were carried out by CRM TECH. In addition, in 2001 CRM TECH performed a cultural resources survey for the City of Fontana General Plan update (Love et al. 2001), which covered the entire project area, although the survey was conducted at a reconnaissance level instead of an intensive level, as is usually required for project-related studies. As a result of these and other similar studies, nine historic-period sites were previously recorded in the project area, but no prehistoric— i.e., Native American—sites were found anywhere within the project boundaries.

The nine recorded historic-period sites include a segment of San Bernardino-Sonora Road (36-16417 / CPHI-SBr-21); four vernacular residences, one from the late 1920s (36-13863) and three from the 1950s (36-13862, 36-13864, and 36-7795); a single iron lamppost with a concrete base, originally from a 1940s gasoline station (36-9862); a segment of the former Southern Pacific Railroad (36-10330); the Declezville spur line on the Southern Pacific (36-7426); and a small portion of the former Kaiser Steel Mill site (36-4131 / CPHI-SBr-71).

Figure 1. Project area (based on USGS Guasti and Fontana, Calif., 1:24,000 quadrangles).

Among these, Site 36-16417 represents the approximate route of the San Bernardino-Sonora Road, also known as the northern branch of the Emigrant Trail. It was delineated solely on the basis of historic maps, which suggest that the old wagon road may have pass through the project area near the present-day intersection of Mulberry Avenue and Jurupa Avenue in the early and mid-19th century. Since then, however, the cultural landscape in the project vicinity has changed drastically, likely obliterating all traces of the old road. No physical remains of the road were ever recorded in the San Bernardino Valley in the numerous cultural resources studies along its course, and it is highly unlikely for any to be encountered in the project area.

The Kaiser Steel Mill (Site 36-4131), built by Henry J. Kaiser in the early 1940s, is recognized as being significant in California and American history as the largest steel mill ever in operation on the West Coast and for the important role it played in the American war efforts during WWII. The mill closed in 1983, and the property was subsequently redeveloped into the California Speedway in the 1990s. While its former site overlaps a small portion of the project area on the northern edge, it is doubtful that any buildings, structures, objects, or features that contribute to the historic significance of the Kaiser Steel Mill would remain in existence within the project boundaries today.

Under CEQA provisions, Sites 36-4131 and 36-16417, both designated California Points of Historical Interest, potentially qualify as "historical resources." However, in light of the lack of important physical properties associated with them within the project area, the proposed project is unlikely to cause substantial adverse changes in the significance of these sites. The other seven recorded sites in the project area, in contrast, demonstrate little potential to be considered "historical resources" under CEQA.

Three of the historic-period residences recorded in the project area, 36-13862, 36-13863, and 36-13864, have been previously determined ineligible for listing in the National Register of Historic Places or the California Register of Historical Resources. The fourth residence, 36-7795, did not exhibit the historic or architectural quality to merit listing in the National Register or the California Register, nor did the iron lamppost (36-9862) or the Southern Pacific's Declezville line (36-7426), a localized spur line built in the late 19th century to serve a granulite quarry located nearby. The Southern Pacific (now Union Pacific) mainline (36-10330), constructed in 1876-1877, played a prominent role in the economic, political, and social history of southern California during late 19th and early 20th centuries. However, as a working component of the modern transportation infrastructure, the existing railroad retains little historic integrity to relate to the site's period of significance.

Outside the project area but within a one-mile radius, EIC and AIC records show over 100 other previous studies covering various tracts of land and linear features (Fig. 2). As a result, 47 additional sites, including 10 prehistoric sites and 37 historic-period sites, and 19 isolates—i.e., localities with fewer than three artifacts—were previously identified within the scope of the records search.

All of the prehistoric archaeological sites were located to the south of the project area, the majority of them concentrated along the foothills of the Jurupa Mountains. Situated on the lower slopes of the foothills were three sites consisting of bedrock milling features with shallow slicks, once used by the Native population to process foodstuffs and other resources. At one of these sites, 36-716, three panels of petroglyphs, or rock art, were also

recorded. Seven sites were found near the base of the foothills, featuring surface scatters of groundstone and/or chipped-stone artifacts of various types and quantities. Eighteen of the isolates were also prehistoric in nature, consisting of either groundstone tools, such as manos or metates, or surface scatters of chipped-stone debitage—i.e., discards from lithic tool manufacturing.

The oldest historic-period site within the one-mile radius was an old vineyard and winery that dated to the mid-1870s. The second oldest was the Declez Ranch, another vineyard and winery complex that once featured a house, ancillary buildings, a windmill, a hand dug well, and a chapel, ca. 1890s. The vast majority of the historic-period sites represented single-family residences built between the 1930s and the mid-1950s in the Tudor, Ranch, Minimal Traditional, and Modern styles, while four other sites consisted of commercial buildings built in the 1950s. One site was recorded as the remains of a WWII-era military complex, namely the Mira Loma Quartermaster Depot. One of the 19 isolates also dated to the historic period, consisting of two shards of sun-altered amethyst glass.

In light of the results of past studies in the vicinity and the fact that the project area has been fully developed, the likelihood of encountering potentially significant prehistoric archaeological remains within the project boundaries appears to be rather low. The records search results generally support the existing prehistoric hunter-gatherer settlement-subsistence models for Inland California, which suggest that longer-term residential settlement was more likely to occur on elevated terraces, hills, and finger ridges near permanent or reliable sources of water, while the valley floor was more often utilized for resource procurement, travel, and opportunistic camping. In the Fontana area, all of the known prehistoric archaeological sites were found near the foothills of the San Gabriel and the Jurupa Mountains, and none was found on the valley floor (Love et al. 2001:6).

In CRM TECH's 2001 study for the Fontana General Plan, the entire city was determined to have moderate level of sensitivity for buildings, structures, objects, or archaeological remains dating to the historic period (Love et al. 2001:9). However, historic maps indicate that the project area, located several miles south of downtown Fontana, experienced significantly less development activities during the historic period than the central portion of the city. In the mid-19th century, the "Emigrant Trail" (Site 36-16417) was the only man-made feature observed in the project vicinity (GLO 1856a; 1856b). In the late 19th century and the mid-20th century, the area exhibited a cultural landscape that was typical for rural southern California at the time, with crisscrossing roads lined by scattered roads and, presumably, large stretches of agricultural land (USGS 1901; 1903; 1941; 1943). The Southern Pacific Railroad (Site 36-10330), its spur line (Site 36-7426), and the Declezville granulite quarry south of the project area were the most notable features in the vicinity.

In summary, the project area appears to be relatively low in sensitivity for cultural resources from both the prehistoric and historic periods. Nonetheless, a determination of low sensitivity does not equal a declaration of "no historical resources." As Figure 2 illustrates, only a small percentage of the project area has been surveyed for cultural resources, making it impossible at this time to make a final determination on whether any additional historical/ archaeological sites, aside from the nine mentioned above, are located within the project area and yet to be recorded. In order to reach that determination, a systematic field survey of the entire project area would be necessary, at least at a reconnaissance level.

Based on these considerations, CRM TECH recommends that once the exact location and configuration a specific development project within the current project area are established, a field survey of the area to be impacted be performed, at least on a reconnaissance level, in compliance with the pertinent statutes and regulations. The objective of the field survey is to identify any historical/archaeological sites that may exist within each specific project area and to facilitate the final determination on whether a proposed project would cause substantial adverse changes to any "historic properties" or "historical resources," as mandated by federal and state laws.

Thank you for this opportunity to be of service. If you have any questions regarding this study or need any further information, please feel free to contact our office.

Sincerely,

A handwritten signature in black ink, appearing to read 'Bai Tom Tang', written over a horizontal line.

Bai "Tom" Tang, Principal Investigator  
CRM TECH

## 1. INTRODUCTION

The Water and Sewer Infrastructure study (Study) has been prepared in support of the Southwest Industrial Park (SWIP) Specific Plan 2009 update. The proposed SWIP Specific Plan boundary is generally defined as the four sub-regions north and south of Interstate 10. The total project consists of approximately 3,109 acres within incorporated City of Fontana and unincorporated San Bernardino County. Exhibit 1-1 shows the regional vicinity within San Bernardino County and Exhibit 1-2 shows the proposed SWIP SP study area and sub-regions.

The current Specific Plan for the SWIP was prepared in 1998 and included only areas within the City of Fontana. The total area was approximately 1843 acres and included agriculture, industrial, and business park uses. The proposed SWIP includes land uses which would enhance the trucking, manufacturing and industrial uses; add warehousing, research and technology uses; expand and enhance commercial uses for office, retail and service; and incorporate some residential mixed-use areas.

As shown in Exhibit 1-2 the Southwest Industrial Park Specific Plan Area is composed of four non-contiguous sub-areas, described as follows:

- West SWIP – this area is bounded by Etiwanda Avenue to the west, Philadelphia to the south, Mulberry Avenue to the east and Jurupa Avenue to the north (approx. 600 acres);
- Central SWIP – bounded by Mulberry Avenue to the west, Jurupa Avenue to the south, Citrus Avenue to the east and the I-10 freeway to the north (approx. 2300 acres);
- Northwest SWIP – bounded by Banana Avenue to the west, Valley Blvd. and I-10 Freeway to the south, Cherry Avenue to the east, and Andel Drive to the north (approx. 160 acres); and
- Northeast SWIP – bounded by Hemlock Avenue to the west, the I-10 Freeway to the south, Beech Avenue to the east and Valley Boulevard to the north (approx. 50 acres)

## 2. LAND USE

The revised Specific Plan study area consists of land within the City of Fontana and currently unincorporated San Bernardino County area. Total acreage of the Specific Plan and areas added for the 2009 update are shown in Table 2-1.

**TABLE 2-1 – SWIP Area**

| <b>Southwest Industrial Park Specific Plan</b> | <b>Acreage</b> | <b>% Acreage</b> |
|------------------------------------------------|----------------|------------------|
| 1998 SWIP Study Area                           | 1,843          | 59.2%            |
| Additional Area                                | 1,266          | 40.8%            |
| <b>Proposed SWIP Area (2009 Update)</b>        | <b>3,109</b>   | <b>100.0%</b>    |

The existing development of the Specific Plan study area includes industrial, commercial, Kaiser High School, and residential uses, along with utility and infrastructure easements and roadways. The expanded study area for the 2009 Specific Plan refines the current General Planning land uses to include specific types of industrial districts. In all, eight industrial districts are proposed primarily as Commercial (Retail, Office and Service), Light Industrial, Warehouse and Manufacturing. Minor development of residential, technology and mixed-use is also proposed. **Appendix A** includes a tabulation of the existing and proposed development within each of the industrial districts envisioned for the SWIP Specific Plan. Exhibit 2-1 shows the proposed redevelopment districts.

The current General Plan land uses within the SWIP Specific Plan include:

- o Light Industrial (I-L)
- o General Industrial (I-G)
- o Public Utility Corridors (P-UC)
- o Public Facilities (P-PF)
- o Community Commercial (C-C)
- o General Commercial (C-G)
- o Open Space (O-S)

The current zoning designations within the SWIP Specific Plan include:

- o Light Industrial (M-1)
- o General Industrial (M-2)
- o Public Facilities (P-PF)
- o Community Commercial (C-1)
- o Specific Plan Areas (SP)
- o Agricultural (A)
- o Industrial-Related Commercial (C)
- o Business Park (BP)
- o Light Industrial (M-1)
- o Medium Industrial (M-2)
- o Transportation Industrial (M2-T)
- o Heavy Industrial (M-2H)

A large portion of the revised SWIP study area is under-utilized or vacant. Table 2-2 summarizes the existing land uses within the proposed SWIP districts.

**TABLE 2-2 – Existing Land Uses**

| Land Use                     | Area<br>(acres) | Building Area<br>(square feet) | Dwelling Units<br>(DU) |
|------------------------------|-----------------|--------------------------------|------------------------|
| Industrial                   | 347             | 963,510                        | -                      |
| Commercial                   | 99              | 181,455                        | -                      |

### **3. WATER SERVICE**

The Southwest Industrial Park SP area is within the service area of the Fontana Water Company (FWC), a private water purveyor which provides water service to the City of Fontana. Based on the 2005 Water System Master Plan, FWC will rely on up to 75 percent of its total water supply from local groundwater sources drawing from the Chino Basin. Therefore, FWC plans to develop new water supply sources based on this percentage, which will require construction of new water facilities for, and possibly within, the SWIP area. The Chino Basin is an adjudicated basin which requires imported sources for basin replenishment. The new facilities are expected to be required due to the estimated increase in water demands of the SWIP area to approximately 3.47 MGD on average, and 6.93 MGD during a maximum summer day. With the proposed implementation of recycled (non-domestic) water service to the SWIP study area, the increase in domestic water demands can be reduced.

IEUA recognizes that the availability of critical imported water sources continue to decline, both in capacity and reliability while the region continues to develop, outpacing water conservation efforts. Also, the Chino Basin Watermaster has documented the economic benefits of maximizing the use of recycled water. Each of IEUA's member agencies are expected to take advantage of the opportunities to offset the need for expensive imported water supplies. IEUA plans to achieve this by maximizing recycled water from their regional distribution system for candidate uses within their member agencies' service areas. The SWIP Specific Plan area may provide the City with industrial customers that will implement centralized boiler and chiller systems, material cooling and washdown systems, as well as landscape irrigation. All of these could potentially be candidate uses of recycled water.

#### **3.1 Existing Water System**

The existing water system serves the current land uses within the SWIP area with potable (domestic) water, and is owned and operated by the Fontana Water Company. Water supply is from local groundwater and surface water sources, and imported water from San Bernardino Valley Municipal Water District (SBVMWD) and Inland Empire Utilities Agency. In order to accommodate the expected increase in water demands for the SWIP study area, FWC will require increased capacity from these sources. The 2005 FWC Water System Master Plan (WSMP) indicates the Company has interest in re-activating groundwater production at sites within, and adjacent to, the SWIP study area.

The existing FWC water distribution system is necessarily divided into service pressure zones to maintain operating pressures within acceptable limits and for water service redundancy and reliability. The service pressure zone serving the study area operates at supply hydraulic gradient of approximately 1260 feet above mean sea level. The SWIP SP study area is at approximate service elevations ranging from 850 feet to 1100 feet. For efficient service to the existing land uses FWC pressure-reduces the Juniper Zone for manageable service pressures south and west of Santa Ana Avenue and Live Oak Avenue.

**Appendix B** includes exhibits copied from the WSMP (Figures 7-1 thru 7-3) and provides a general understanding of the City-wide system operation. Exhibit 3-1

shows the existing distribution piping system and proposed improvements within the SWIP study area.

### **3.2 Water Demand**

Water demand for both existing and ultimate conditions of the SWIP area was estimated for the Study. In the absence of historic meter records, an estimate of the existing landuses and percent buildout was determined using current zoning and aerial images. Standard water demand usage factors were applied to the existing land uses, which calculates to average and maximum-day water demands of the SWIP area of 1.49 MGD (1,673 AF/yr) and 2.99 MGD, respectively. The calculations are shown in Table 3-1. The ultimate land uses for the update to the Specific Plan, as determined above, include total building square footage of approximately 39.8 million square feet. The corresponding average and maximum-day water demands are estimated at 3.46 MGD (3,882 AF/yr) and 6.93 MGD, respectively, as shown in Table 3-2.

It's important to recognize at this concept planning phase that a significant component of the ultimate demands may be served from non-domestic water sources, such as recycled water. Although fire flows are an accepted use of recycled water, concerns arising from fire engine pumping systems and fire fighter bodily contact, has generally prevented this from an accepted use of recycled water. As the volume of water required for fire fighting purposes is relatively minor, it is recommended that the development and expansion of the water distribution systems for the SWIP area be developed based on fire flow from the domestic water system. The FWC's 2005 WSMP designates a fire flow capacity for the original SWIP SP study area. With the proposed expansion of the SP, the Infrastructure Study assumes the fire flow requirement for all proposed SWIP districts of 5,000 gpm in order to provide for planning flexibility. Table 3-3 summarizes the estimated existing and ultimate water demands for the SWIP SP area.

### **3.3 Domestic Water System Evaluation**

The SWIP SP area is within the FWC Juniper pressure zone and serves the existing land uses. Due to the range of service elevations, the Juniper system is divided into high and low subzones. The SWIP topography generally slopes southwesterly with the highest elevations at Citrus and Slover Avenues. The service boundary is generally defined by Santa Ana Avenue and Live Oak Avenue – development to the north and east are served by the Juniper-high subzone, while the remainder of the SWIP area to the south and west are served through pressure-reducing stations for the Juniper-low subzone.

#### ***Storage and Pumping***

Distribution storage and pumping work in unison with the pipeline conveyance system in order to effectively distribute service flows to all customers within the Juniper Zone. Juniper Zone storage tanks directly “float” the Juniper-high subzone from off-site storage facilities with a total capacity of 7.1 MG. Optimum distribution storage capacity is typically 50- to 100-percent of daily demand volume, depending on operational needs and desired level of service redundancy. In addition, fire flow volume may also be included in distribution storage tanks. Optimum pumping capacity is typically between 100- and 150-percent of maximum daily flow, plus fire flow if fire flow volume is not included in “floating” storage. According to the WSMP, the ultimate Juniper Zone storage requirement is 4.56 MG. The SWIP water demand estimated for the WSMP should be verified; however, it appears any increase in proposed SP land use densities over those anticipated in the WSMP can be accommodated in existing storage.

#### ***Distribution System***

Existing distribution capacity may be sufficient for ultimate SWIP land uses. Hydraulic analysis using computer simulation should be performed as part of master planning and preliminary design of the initial system upgrades. This will provide FWC engineering staff alternative looping and pipe size configurations, for flexibility and constructability, to meet critical service scenarios. For the purposes of the Study, it is assumed that fire flow requirements would dictate the sizing of the distribution system. In order to meet standard accepted velocity and headloss criteria during fire flow conditions, RBF has developed the following chart to use as a guide to general rule-of-thumb minimum pipe sizes:

| <u>Land Use Designation</u> | <u>Possible FF<br/>Requirement</u> | <u>Planning-Level<br/>Minimum Pipe size</u> |                |
|-----------------------------|------------------------------------|---------------------------------------------|----------------|
|                             |                                    | <u>Dead end</u>                             | <u>Looping</u> |
| Commercial, Retail          | 3,500 gpm                          | 12-inch                                     | 10-inch        |
| Commercial, Office          | 5,000 gpm                          | 16-inch                                     | 12-inch        |
| Service Commercial          | 3,500 gpm                          | 12-inch                                     | 10-inch        |
| Light Industrial            | 5,000 gpm                          | 16-inch                                     | 12-inch        |
| Live/Work                   | 5,000 gpm                          | 16-inch                                     | 12-inch        |
| Flex Tech                   | 5,000 gpm                          | 16-inch                                     | 12-inch        |
| Warehousing                 | 5,000 gpm                          | 16-inch                                     | 12-inch        |
| Manufacturing               | 5,000 gpm                          | 16-inch                                     | 12-inch        |
| Residential                 | 1,500 gpm                          | 10-inch                                     | 8-inch         |

Currently, FWC does not operate a separate recycled water distribution system within the SWIP area. However, IEUA plans to construct the Wineville Extension for delivery of recycled water from their RP-4 wastewater treatment plant at 1158 feet HGL (**Appendix C**). This nominal operating HGL of the delivery system could allow for direct service within the West SWIP sub-area. All other sub-areas will likely require FWC develop a higher zone of operation parallel to their domestic water Juniper-high zone system. The potable water system exhibit (Exhibit 3-1) shows the currently planned location of the Wineville Extension in Marley Avenue. It is estimated that this system could serve candidate non-domestic water uses and conserve potable water sources.

#### ***Recommended SWIP Distribution Systems***

It is recommended that the SWIP area domestic water distribution system be upgraded pursuant to the 2005 WSMP concept shown on Exhibit 3-1. As noted in the table above, additional capacity upgrades may be necessary for isolated areas without 12-inch or larger transmission pipelines. Fire Department flow requirements should be validated on a case by case basis, and hydraulic analysis simulation performed to verify service capacity and reliability for adequate service.

## **4. WASTEWATER SERVICE**

The Southwest Industrial Park SP area is within the sewer service area of the City of Fontana and the Inland Empire Utilities Agency (IEUA). Fontana is a member agency of the IEUA, which provides the City contracting privileges with the Agency for off-site collection, treatment, disposal and reuse. Previous planning concepts included construction of a treatment plant within the City, which would have required regional sewerage lift station(s) and force main system(s) for serving the SWIP land users. However, current planning is now focused on gravity service for most of the SWIP area.

The City is currently updating their 2000 Sewer Master Plan. The new master plan will consider IEUA wastewater treatment capacity at their reclamation plants that serve the City, and their recycled water delivery system. The new master plan is also performing extensive flow monitoring and investigating flow factors and peaking formulas. Improved capacity projections will optimize sewer life and ensure improvement projects are scheduled in a timely manner.

New trunk sewer systems are expected to be required to expand sewer service within the SWIP area. Under the Specific Plan, wastewater generation is estimated to increase to approximately 3.02 MGD, or approximately 2,100 gpm, on average. For the purposes of the Study, peak flow is assumed to be twice the average flow (Peaking Factor = 2.0), to account for higher water usage in the summer time and higher inflow and infiltration rates in the winter time during wet-weather conditions. Land uses within the south portion of the West SWIP sub-area will require lift stations if the City deems the wastewater flows from this area essential for reclaiming.

IEUA Regional Plants 1 and 4 (RP-1 and RP-4) treat the majority of the City wastewater. RP-4 is planned as the recycled water source for the City of Fontana. The issues regarding the decisions to maximize recycled water use are (1) FWC's need for supplemental water supply from local sources, and (2) water resources management of the Chino Basin.

#### **4.1 Existing Wastewater Collection System**

The existing wastewater collection system serves only current land uses within city limits and is owned and operated by the City of Fontana. Current land uses within the SWIP study area, but not within current city limits are served by private systems. Two major collection systems owned and operated by the IEUA serve City flows and are located within West SWIP in Jurupa Avenue and Marlay Avenue. These systems collect all flow from the SWIP area and much of the eastern portion of Fontana. (**Appendix D** is a copy of the City-wide collection system and 2000 Sewer Master Plan.) A City flow control structure at Jurupa Avenue and Beech Avenue allows the City to optimize the capacities of each system. Exhibit 4-1 shows the existing collection system and proposed city sewers pursuant to information received from engineering staff.

IEUA serves the treatment and disposal needs of the City. In order to accommodate the expected increase in wastewater from the SWIP Specific Plan, the City will require increased capacities from IEUA treatment and disposal facilities, and City collection facilities. In addition, the two agencies have plans to expand recycled water service from off-site treatment plants to the SWIP area.

#### **4.2 Wastewater Flows**

Wastewater flows for both existing and ultimate conditions of the SWIP area were estimated for the Study. Currently only those wastewater generators within the incorporated City limits are sewered and contribute flows to the IEUA system, according to City engineering staff. In the absence of historic non-irrigation water meter records, which can closely mimic wastewater flows, an estimate of the existing landuses and percent buildout was determined using current zoning and

aerial images. Standard wastewater flow factors were applied to the existing land uses, and calculate to an average wastewater generation within the SWIP area of 1.20 MGD, of which a portion is served by the City's sewer system and disposed of to IEUA's regional system. The estimate is shown in Table 4-1.

The ultimate land uses for the update to the Specific Plan include total building square footage of approximately 39.8 million square feet. The corresponding average wastewater flow is estimated at 3.02 MGD, as shown in Table 4-2. All unincorporated areas within the SWIP are proposed to be annexed into the City of Fontana and planned to be added to the City's sewer system. The estimated existing and ultimate wastewater flows are summarized in Table 4-3.

**Table 4-1**

### 4.3 Wastewater System Evaluation

The existing topography within the SWIP area ranges in elevation from 1100 feet (above mean sea level) at the northeast end to 850 feet at the southwest end. The general drainage direction from the northeast to the southwest is at an average slope of approximately one percent. Although this would seem favorable for gravity sewer systems, constraints not foreseeable at the concept planning phase, for areas not currently sewered and those areas that may require sewer upgrades, will likely prove challenging to maintaining gravity flow conditions during design and construction. During interim operating conditions of the expanded use areas to be annexed into the City, temporary lifting for service flows from individual development projects may be necessary. The City has little control of development phasing of the SWIP area; therefore, the Study does not evaluate phased system operation.

#### ***On-site Collection System***

Existing sewerage collection capacity may be sufficient for ultimate SWIP land uses of the areas currently within the City limits. New sewer systems will be required for the annexation areas. Hydraulic analysis using computer simulation should be performed as part of master planning and preliminary design of the initial system upgrades. This will provide the City engineering staff alternative collection alignment and pipe size configurations to meet critical service flow scenarios of the annexation areas. Alternative configurations will be essential as the City moves into the design phase for system expansion to serve development and redevelopment projects pursuant to the Specific Plan. For the purposes of the Study and to meet standard minimum velocity criteria during dry weather conditions, RBF recommends using the following chart as a guide to minimum slopes and pipe sizes for precluding solids settlement and minimizing sewer pipe scour:

**Table 4-4 – Standard Gravity Sewer Flow Characteristics**

| Size    | Allowable<br>d/D | Minimum<br>Slope | Velocity at Allowable d/D (fps) |                |

#### ***Recommended SWIP Wastewater Collection System***

It is recommended that the SWIP area sewer system be expanded pursuant to the needs of annexation, development and redevelopment activities. As the unincorporated areas are currently unsewered, and much of the Specific Plan

area is under-utilized, estimated flows for each trunk sewer system should be revised as these activities occur, in order to optimize sewer sizing. In addition, potential trunk system alignment modifications may be in order to efficiently serve new parcel construction. The new City sewer master plan is scheduled to be completed in 2009, and should incorporate the development planning concepts of the SWIP. Flow estimates should be validated on a parcel-by-parcel basis as individual site projects secure entitlements, and hydraulic analysis simulation performed to update the SWIP sewer master plan. In addition, interim collection facilities, including lift stations, may be necessary as a cost-saving measure until ultimate collection systems are constructed.

## 1.0 EXECUTIVE SUMMARY

The present and future water supplies available to Fontana Water Company are groundwater pumped from the Chino Basin, Lytle Basin, Rialto Basin, and No-Man's Land, surface water diversions from Lytle Creek, imported SWP water from IEUA and SBVMWD, and recycled water. The surface and groundwater sources have been adjudicated. Chino Basin, the largest basin, has enhanced reliability during drought and is a significant and reliable source of water supply.

Fontana Water Company's water supply reliability is partially related to IEUA's water management goals and implementation of strategies, such as its imported untreated water distribution policy of supplying supplemental imported SWP water directly to water purveyors like Fontana Water Company in addition to MWD water to the Chino Basin Watermaster for groundwater recharge, exchange, groundwater banking, conjunctive use programs, and the use of recycled water. IEUA has also analyzed future water demands and water supplies within its service area, including a large portion of Fontana Water Company's service area, and concluded that sufficient water supplies will be available for the next twenty years.

Based on analysis of historical water supplies, water rights, Fontana Water Company's Water System Master Plan, Fontana Water Company's and IEUA's Urban Water Management Plans, and consideration of recent restrictions on SWP water, this Water Supply Assessment shows clearly that Fontana Water Company's available water supplies will be sufficient to meet the water demands in Fontana Water Company's service area with the Project for the next twenty years.

## **2.0 INTRODUCTION**

### **PROJECT DESCRIPTION**

The Southwest Industrial Park Project (Project) is located within the southwestern portion of Fontana Water Company's service area as approved by the California Public Utilities Commission (CPUC) (Figure 1). The Project includes areas bounded primarily by Philadelphia Avenue and Jurupa Avenue to the south, Etiwanda Avenue and Mulberry Avenue to the west, San Bernardino Avenue to the north, and Citrus Avenue to the east. Currently there are 11,468,742 square feet of industrial and commercial development and 577 residential units within the Project area. Based on current information provided by RBF Consulting, the City of Fontana's consultant on this project, there will be 39,568,777 square feet of industrial, commercial, and warehouse development and 180 residential units within the Project area at buildout.

## **PURPOSE AND SCOPE OF ASSESSMENT**

The Project is located entirely within Fontana Water Company's CPUC certificated service area as shown in Figure 1. Fontana Water Company is ready, willing, and able to provide all necessary water utility service to meet the water supply needs within the Project. The Project is within that part of Fontana Water Company's service area which is within the Inland Empire Utilities Agency's (IEUA) service area. IEUA is a regional agency providing Colorado River and State Water Project (SWP) water from Metropolitan Water District of Southern California, wholesale sales and distribution of untreated imported and recycled water supplies, and sewage treatment. Figure 2 visually depicts the relationship between IEUA's service area, Fontana Water Company's service area, and the Project area.

Fontana Water Company will provide all public utility water service to the entire Project. The reliability of future water supply provided by Fontana Water Company is directly related to the Company's longstanding water rights and access to local renewable groundwater and surface water supplies as listed in Table 1 (Summary of Fontana Water Company Water Rights). It is also partially related to IEUA's water management goals and implementation strategies, such as its imported water distribution policy, groundwater banking programs, and the use of recycled water. This Water Supply Assessment (WSA) evaluates all available water supply sources and projected water demands for Fontana Water Company's service area and the Project area as well as IEUA's service area, with an emphasis on Fontana Water Company's service area.

**TABLE 1 SUMMARY OF FONTANA WATER COMPANY WATER RIGHTS**

| Sources of Supply                                                | Water Right                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                              |

### Water Supply Planning Provisions

Population growth in the State of California has resulted in additional water demand on water systems. The State legislature has enacted laws to ensure that the increased demands are adequately addressed and that a firm source of water supply is available prior to approval of certain new developments. The regulations include Senate Bill 610 (SB610), authored by Senator Jim Costa, and Senate Bill 221 (SB221), authored by Senator Sheila Kuehl, which are briefly described below. SB610 and SB221 are companion measures which seek to promote more collaborative planning between local water suppliers and cities and counties. SB610 (which amended California Water Code Sections 10910-10912) and SB 221 (which amended Government Code 66473.7) require detailed information regarding water availability to be provided to city and county land use planners prior to approval of certain specified large land use development projects. This WSA, prepared pursuant to the

City of Fontana's request, was prepared in accordance with the guidelines in California Water Code sections 10910-10912 for the approach, required information, and criteria to be used in determining sufficient supply for a water supply assessment. The Urban Water Management Plan (UWMP) is a foundational document for compliance with both Water Code Sections SB610 and SB221. Both SB610 and SB221 repeatedly identify the UWMP as a planning document that can be used by a water supplier to meet the standards set forth in both statutes. California Environmental Quality Act (CEQA) guidelines section 15083.5 contains similar provisions regarding consultation with water agencies for certain projects. Fontana Water Company's UWMP (December 2005) and IEUA's 2005 Regional UWMP (November 2005), both prepared pursuant to California Water Code sections 10610 through 10656, describe future water demands and future availability of the water supply sources used by Fontana Water Company and other retail water agencies in its service area. Information from IEUA's 2005 UWMP has been incorporated into Fontana Water Company's 2005 UWMP. Fontana Water Company's and IEUA's UWMPs, were used along with Fontana Water Company's Water System Master Plan Update (August 2008), to prepare this Water Supply Assessment.

### **SB610 (Costa)**

Existing law requires every urban water supplier to identify, as part of its UWMP, the existing and planned sources of water available to the supplier over a prescribed 5-year period. Existing law prohibits an urban water supplier that fails to prepare or submit its UWMP to the Department of Water Resources from receiving drought assistance from the state until the plan is submitted.

SB610 requires an urban water supplier to include in its UWMP a description of all water supply projects and programs that may be undertaken to meet total projected water use over the next 20 years. SB610 requires a city or county that determines a project is subject to the California Environmental Quality Act to identify any public water system that may supply water for the Project and to request those public water systems to prepare a specific water supply assessment. If the water demand for the proposed development has been

accounted for in a recently adopted urban water management plan, the water supplier may incorporate information contained in that plan to satisfy certain requirements of a water supply assessment. SB610 requires the assessment to include, along with other information, an identification of existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project and the quantities of water received in prior years pursuant to those entitlements, rights, and contracts.

SB610 also requires the public water system, or the city or county, as applicable, to submit its plans for acquiring additional water supplies if that entity concludes that water supplies are, or will be, insufficient.

#### **SB221 (Kuehl)**

SB221 prohibits approval of a tentative map, or a parcel map for which a tentative map was not required, or a development agreement for a subdivision of property of more than 500 dwelling units, except as specified, including the design of the subdivision or the type of improvement, unless the legislative body of a city or county or the designated advisory agency provides written verification from the applicable public water system that a sufficient water supply is available or, in addition, a specified finding is made by the local agency that sufficient water supplies are, or will be, available prior to completion of the project. Sufficient water supply is the total water supply available during normal, single-dry, and multiple-dry years within a 20-year projection that will meet the projected demand of the proposed subdivision.

### **3.0 HISTORICAL WATER SUPPLIES AND USES IN THE FONTANA WATER COMPANY SERVICE AREA**

#### **HISTORICAL WATER SUPPLIES IN THE FONTANA WATER COMPANY SERVICE AREA**

Fontana Water Company is an investor owned public utility water company subject to the regulatory jurisdiction of the CPUC. Fontana Water Company provides public utility water service in most of the City of Fontana and in portions of the cities of Rialto and Rancho Cucamonga, and in adjoining unincorporated areas of San Bernardino County. The Company's CPUC-approved service area encompasses approximately 52 square miles bordered generally by the Riverside County line on the south, Etiwanda and Cherry Avenues on the west, Lytle Creek Wash and Linden Avenue on the east, and Highland and Summit Avenues on the north, as shown on Figure 1.

Fontana Water Company currently derives its water supply from 38 water production wells (five of these wells are awaiting installation of wellhead treatment facilities to remove groundwater contamination) and a surface water treatment plant, the Sandhill Water Treatment Plant. The water supply is produced from groundwater wells in the Chino Basin, Rialto Basin, Lytle Basin, and No-Man's Land (an unnamed basin between the Chino Basin and the Rialto Basin), and surface water from Lytle Creek. Fontana Water Company also purchases untreated SWP water from IEUA and San Bernardino Valley Municipal Water District (SBVMWD). The groundwater basins are shown on Figure 3. Fontana Water Company receives well water, surface water, or a combination of those sources at various points in its water distribution system.

Table 1 summarizes water rights held by Fontana Union Water Company (FUWC) which are subject to Fontana Water Company's irrevocable right to utilize, pursuant to court-approved agreements. Fontana Water Company is a principal shareholder of FUWC. Historical annual water supplies utilized by Fontana Water Company are summarized in Table 2 and Figure 4. The data shows that historical annual water supply production increased in response to increasing demands. Annual average water supply production increased from 26,439 AF in 1988 to 47,581 AF in 2008, with an average annual increase of approximately 1,057 AFY.

**TABLE 2 HISTORICAL ANNUAL WATER SUPPLY PRODUCTION BY FONTANA WATER  
COMPANY (AFY)**

| Year | Groundwater    |                |                 |                      | Subtotal | SWP<br>Water | Surface<br>Water | Total  |

Notes:

“SWP Water” deliveries to Fontana Water Company began in 2002

“Surface Water” includes State Water Project deliveries (“SWP Water”)

**FIGURE 4 HISTORICAL ANNUAL FONTANA WATER COMPANY WATER SUPPLY PRODUCTION**

The following describes the sources of water supplies and water rights in more detail.

### **Chino Basin**

The Chino Basin is an important groundwater source for Fontana Water Company. In the last five years, Fontana Water Company produced approximately 14,700 AFY to 25,000 AFY from the Chino Basin, which accounts for one third to almost half of Fontana Water Company's total water supply.

The Chino Basin, in San Bernardino County, is the largest groundwater basin in the Upper Santa Ana River Watershed. The Chino Basin is bounded by the Rialto-Colton, Chino, San Jose, and Cucamonga faults, and by Puente Hills and the San Gabriel Mountains. The total surface area of the basin is approximately 154,000 acres (240 sq. miles).

The Chino Basin currently contains 5 million acre-feet (AF) of water in storage, with an additional unused storage capacity, based on historical water levels in the basin, of about 1 million AF. Currently, total groundwater production from the basin is approximately 165,000 AFY. Approximately 120,000 AFY is pumped for municipal and industrial purposes and approximately 45,000 AFY is pumped by 300 to 400 agricultural producers.

The Chino Basin was adjudicated under a Judgment (Chino Basin Judgment), entered on January 27, 1978 by the Superior Court for the County of San Bernardino. Fontana Water Company is a party to the Chino Basin Judgment and is classified as an appropriator. The Chino Basin Judgment established an average Safe Yield in the Chino Basin of 140,000 AFY (July 1 to June 30) and allocated water production rights to an “Appropriative Pool (49,834 AFY)” first, an “Overlying Agricultural Pool (82,800 AFY)”, and an “Overlying Non-Agricultural Pool (7,366 AFY)”. Table 3 presents the historical Chino Basin production by Pool.

Parties to the Chino Basin Judgment who are members of the Appropriative Pool, like Fontana Water Company, are authorized to produce groundwater in quantities necessary to meet their customers’ requirements for water for beneficial use. Such extractions result in pumping assessments by the Chino Basin Watermaster to pay for water to replenish the basin, through imported surface water recharge. Water to replenish the Chino Basin is purchased from Metropolitan Water District of Southern California (MWD) by IEUA in coordination with the Chino Basin Watermaster. Future additional supplemental sources of replenishment water are expected to include recycled water and increased conservation of storm water. In addition, water is reallocated to the Appropriative Pool for urban use from the Overlying Agricultural Pool when it is not used by agricultural producers. As agricultural production declines in the Chino Basin, the reallocation of water to the Appropriative Pool is expected to increase. Reliability of water purchased from IEUA to replenish the Chino Basin is discussed in Section 4.

**TABLE 3 HISTORICAL CHINO BASIN PRODUCTION BY POOL <sup>1</sup> (AF)**

| <b>Fiscal Year</b> | <b>Appropriative Pool</b> | <b>Overlying Agricultural Pool</b> | <b>Overlying Non-Agricultural Pool</b> | <b>Total</b> |
|--------------------|---------------------------|------------------------------------|----------------------------------------|--------------|
| 1974-75            | 70,312                    | 96,567                             | 8,878                                  | 175,757      |

## **Lytle Creek Region**

The Lytle Creek Region consists of Lytle Creek and the Lytle Basin. The Lytle Creek watershed is approximately 46.4 square miles. The area of the Lytle Basin is approximately 22.3 square miles.

The 1897 McKinley Decree specifying surface water allocations and the January 28, 1924 Judgment by the Superior Court for the County of San Bernardino confirming the McKinley Decree and specifying allowed groundwater production, allow Fontana Water Company to divert or produce surface and groundwater from the Lytle Creek region in the amount of 3,480.78 miner's inches, or 69.6 cfs (~50,400 AFY). The amount includes 2,500 miner's inches, (~36,200 AFY) of allowable combined surface and groundwater extractions to augment deficiencies in surface water diversions. Fontana Water Company is allowed to extract and divert at least 1,300 miner's inches, or 26 cfs (~18,800 AFY) of groundwater from the Lytle Creek Region, depending on availability. Since the Lytle Basin groundwater and surface water supplies are highly variable and are not always fully available during dry years, Fontana Water Company has not always been able to divert its full allocation.

## **Rialto Basin**

The Rialto Basin is located within western San Bernardino County. The basin is approximately bounded by the Rialto-Colton and San Jacinto faults, the San Gabriel Mountains, and the Santa Ana River. The total surface area of the basin is approximately 23.4 sq. miles.

Fontana Water Company is entitled to produce water from the Rialto Basin with no extraction limit in most years. Certain producers in the Rialto Basin are subject to a Decree (Rialto Basin Decree), entered on December 22, 1961 by the Superior Court for the County of San Bernardino. Under specified conditions, production may be limited during certain months. Extractions for any given water year (October 1 to September 30) are affected by groundwater elevation measurements which are taken between March and May for three specific "index" wells (Duncan Well, Willow Street Well, and Boyd Well).

In addition to its irrevocable right to pump water pursuant to rights held by FUWC, Fontana Water Company can pump an additional 1,600 acre feet of water from the Rialto Basin during any period of pumping limitation, pursuant to a long term water rights lease with the City of Rialto.

### **No-Man's Land Basin**

There is no restriction on the quantity of groundwater Fontana Water Company is entitled to produce from the No Man's Land Basin. This unnamed basin (also referred to as No-Man's Land) is located between the Rialto and Chino Basins. The No-Man's Land Basin is hydrogeologically separate from the Chino and Rialto Basins. The geology of the No-Man's Land Basin is similar to that of both the Chino and Rialto Basins. Water production from this basin is not a part of either the Chino Basin Adjudication or the Rialto Basin Decree and is not subject to water production restrictions. Groundwater pumping rights in the No-Man's Land Basin are governed by the U.S. Bankruptcy Court confirmed Plan of Reorganization for FUWC which affects FUWC, Fontana Water Company, Cucamonga Valley Water District, and other parties.

### **IEUA**

IEUA, originally known as Chino Basin Municipal Water District, was formed by popular vote of its residents in June 1950, to become a member agency of the Metropolitan Water District (MWD) of Southern California for the purpose of importing supplemental water to augment local stream and groundwater supplies. Since its formation in 1950, IEUA has significantly expanded its services. These include production of recycled water, wholesaling of untreated imported water and recycled water supplies, sewage treatment, co-composting of manure and municipal biosolids, desalinization of groundwater supplies and disposal of non-reclaimable industrial wastewater and brine. Nevertheless, IEUA is not able to provide treated MWD water to retail water purveyors in its service area.

Fontana Water Company is a retail water agency within IEUA's service area. Fontana Water Company has upgraded (including construction of conventional pretreatment facilities and capacity expansion) its existing surface water treatment plant (the Sandhill Water Treatment Plant) to treat SWP water from IEUA and SBVMWD, in addition to surface water from Lytle Creek. The Sandhill Water Treatment Plant upgrades increased the plant's

capacity from 17 MGD to 29 MGD. Fontana Water Company can receive up to 24,000 AFY (through a 40 cfs connection) of untreated imported SWP water from IEUA and 5,000 AFY (through a 14 cfs connection) of untreated imported water from SBVMWD. IEUA's water management goals and implementation strategies, such as its imported water distribution policy, groundwater banking, conjunctive use programs, and use of recycled water, etc., improve the reliability of the water supplies utilized by Fontana Water Company. The following discussion of water sources, future water demands, and future water supplies in IEUA's service area illustrates that sufficient water is available for Fontana Water Company and the other purveyors within IEUA's service area in the future.

IEUA wholesales untreated water and provides industrial/municipal wastewater collection, treatment services, and other related services for the western portion of San Bernardino County. IEUA's service area is located in the southwestern section of San Bernardino County. The 242 square mile service area, which encompasses the Chino Groundwater Basin, consists of a relatively flat alluvial valley from east to west which slopes downward from north to south at a one to two percent grade.

IEUA's service area includes the cities of Chino, Chino Hills, Fontana, Montclair, Pomona, Ontario, Rancho Cucamonga and Upland. Approximately 790,000 people resided in IEUA's service area as of 2005. IEUA's service area, as shown in Figure 2, lies almost entirely within the Chino Groundwater Basin.

Water used in IEUA's service area comes from both local and imported sources. Local sources include local groundwater, surface water and, most recently, recycled water. IEUA purchases untreated imported water from MWD for wholesale redistribution to local retail water purveyors within its service area, including Fontana Water Company. The imported MWD water must first be treated by the local retail water purveyors before delivery to their potable water customers.

Total local groundwater production by Fontana Water Company and other local retail water agencies in IEUA's service area ranged from approximately 150,000 to 170,000 AFY from 1995 to 2005 according to IEUA's 2005 UWMP. These figures include production from the Chino Basin as well as the other local groundwater sources shown in Figure 3.

Fontana Water Company and a number of other retail water agencies in IEUA's service area that produce groundwater from the Chino Basin also obtain a portion of their water from local surface sources. The principal sources of surface water include San Antonio Canyon, Cucamonga Canyon, Day Creek, Deer Creek, Lytle Creek, and several smaller surface streams. Production from all such surface supplies ranged from approximately 9,000 to 27,000 AFY from 1995 to 2005 according to IEUA's 2005 UWMP.

MWD provides untreated imported water to IEUA. Fontana Water Company is able to purchase and receive up to 24,000 AFY of MWD imported SWP water from IEUA for treatment at Fontana Water Company's existing Sandhill Water Treatment Plant. Historical MWD deliveries to IEUA's service area are shown in Table 4. Untreated imported water for direct use has increased significantly in the past twenty years from approximately 9,729 AF of water in fiscal year 1988 to a peak of approximately 81,616 AF in fiscal year 2008. Additional imported water supplies from IEUA are used for groundwater replenishment thereby augmenting the annual yield and production from the Chino Basin.

Table 4 MWD Historical Water Purchases by IEUA <sup>1</sup> (AFY)

| Fiscal Year          | Appropriative Pool | Overlying (Agricultural)<br>Pool | Overlying (Non<br>Agricultural) Pool | Storage <sup>2</sup> | Total      |
|----------------------|--------------------|----------------------------------|--------------------------------------|----------------------|------------|

2) Seasonal Storage Service Program and Cyclic Storage Account

3) Source: Metropolitan Water District of Southern California (<http://www.mwdh2o.com/mwdh2o/pages/operations/ops01.html>). Data includes full service, agricultural, local project, and/or storage program sales)

Water recycling involves treatment of wastewater to create a high quality, safe source of water for landscape irrigation, industrial uses, and groundwater recharge. Recycled water is a critical component of the Optimum Basin Management Plan developed by the Chino Basin Watermaster in 2000 to address water supply and quality issues in the Chino Basin. Recycled water will become an increasingly important source of local water supply for the region which Fontana Water Company plans to provide , when it is available, to customers in its service area who are able to use recycled water. Production of recycled water was approximately 68,000 AF in IEUA's service area in the year 2005, and is expected to increase to 104,000 AF by the year 2025. A recycled water marketing program was initiated by IEUA in 1999. Annual recycled water sales were about 8,000 AF in the year 2005, and are projected to be approximately 69,000 AF in the year 2025. Remaining future projected recycled water supplies will be used for groundwater recharge purposes and to meet Santa Ana River obligations.

The population within IEUA's service area is projected by the local retail water agencies (including Fontana Water Company) to grow from approximately 814,200 in 2005 to over 1,108,400 people by the year 2025 (Table 5). This represents an increase of approximately 300,000 people over a twenty-year period, an average annual growth rate of approximately 1.6%.

**TABLE 5 PROJECTED POPULATION IN IEUA'S SERVICE AREA <sup>1</sup>**

| <b>Year</b>       | <b>2005</b> | <b>2010</b> | <b>2015</b> | <b>2020</b> | <b>2025</b> |
|-------------------|-------------|-------------|-------------|-------------|-------------|
| <b>Population</b> | 814,168     | 894,800     | 982,600     | 1,050,500   | 1,108,400   |

*1) Source: IEUA 2005 Regional Urban Water Management Plan (November 2005)*

As a result of this projected regional population growth, water demand in IEUA's service area is expected to increase by approximately 40% over the twenty year period from 2005 to 2025. Table 6 presents the projected water demands for IEUA's service area. Total annual water use without conservation is expected to increase from approximately 244,200 AF in 2005 to approximately 341,400 AF by the year 2025 according to IEUA's 2005 UWMP.

The implementation of conservation programs is expected to reduce projected municipal and industrial demands within IEUA's service area. With full implementation of the California Urban Water Conservation Council's Best Management Practices, described in Fontana Water Company's CPUC Water Action Plan conservation measures and IEUA's 2005 Regional UWMP, IEUA and Fontana Water Company could reduce ultimate per capita water demands in its service area by at least 10% by 2015 and 20% by 2020.

Projected water supplies within IEUA's service area include groundwater, surface water, recycled water, and untreated imported water purchased from MWD. Table 7 summarizes the available supplies and water demands under a normal year.

**TABLE 7 IEUA FUTURE WATER DEMAND/SUPPLY BALANCE IN NORMAL YEARS <sup>1</sup> (AFY)**

| <b>Year</b>                      | <b>2010</b>    | <b>2015</b>    | <b>2020</b>    | <b>2025</b>    |

| <b>Surplus</b>                   | <b>41,770</b>  | <b>46,479</b>  | <b>48,104</b>  | <b>48,554</b>  |

1) Source: IEUA 2005 Regional Urban Water Management Plan (November 2005)

2) Includes groundwater from Chino Basin and other adjacent basins.

3) Includes water conservation

Total production from the Chino Basin and adjacent groundwater basins is projected to increase from approximately 178,000 AFY in 2010 to approximately 213,000 AFY in 2025 for normal years according to IEUA's 2005 UWMP, although the basin could accommodate much greater water production rates if necessary.

Based on IEUA's 2005 UWMP total production from surface water supplies within IEUA's service area is projected at approximately 18,700 AFY through the year 2025 for normal years according to IEUA's 2005 UWMP. Surface water flows are substantially greater in wet years and less during dry years.

Recycled water use within IEUA's service area in the year 2005 was approximately 8,000 AF. Recycled water use during normal years is expected to increase to approximately 69,000 AFY by 2025. Fontana Water Company is currently working with IEUA and the City of Fontana to design, construct, and operate the initial phase of a direct use recycled water distribution system in Fontana Water Company's service area. Fontana Water Company will be the recycled water purveyor for this and future recycled water projects within Fontana Water Company's service area.

The demand for direct delivery of untreated imported Colorado River and SWP water for the Chino Basin in normal years is projected to increase from approximately 60,200 AFY, currently, to approximately 82,500 AFY by the year 2025, an increase of 37%.

IEUA is developing a mix of water management strategies to meet the region's long-term needs. IEUA's water management goals are the following:

- Implement an effective conservation program that will maximize efficient water use and reuse in IEUA's service area;
- Continue development of a groundwater recovery program;
- Increase the safe storage capacity of the Chino Basin to 100,000 AFY and implement a conjunctive use/groundwater management program that provides dry year water supplies for the service area by 2008 (the increased safe storage capacity potential is 500,000 AFY);
- Achieve maximum use of all available storm water;
- Achieve maximum reuse of all available recycled water; and

- Minimize dependence on imported water supplies.

The water demands and supplies for IEUA's service area were analyzed by IEUA to assess the region's ability to meet demands given a repeat of California's severe 1987-1990 drought. Table 8 and Table 9 present the supply-demand balance for single and multiple year drought scenarios for the year 2010 and 2025. With the implementation of the local programs outlined above, the region is expected to meet 100% of its dry year demand.

**TABLE 8 COMPARISON OF 2010 WATER SUPPLY AND DEMAND IN IEUA'S SERVICE AREA IN NORMAL, SINGLE DRY, AND MULTIPLE DRY YEARS <sup>1</sup> (AFY)**

| Demand and Supply                                |                     | Normal Year | Single Dry Year | Multiple Dry Years |            |            |
|--------------------------------------------------|---------------------|-------------|-----------------|--------------------|------------|------------|

## **SBVMWD**

SBVMWD was formed in 1954. It is an independent SWP contractor and is not a member agency of MWD. The District's services include providing wholesale distribution of untreated imported SWP water, and wastewater, stormwater disposal, recreation, and fire protection services.

SBVMWD, which covers approximately 325 square miles in southwestern San Bernardino County, serves a population of approximately 600,000. SBVMWD's service area includes the eastern two-thirds of the San Bernardino Valley, the Crafton Hills, and a portion of the Yucaipa Valley, and includes the cities and communities of San Bernardino, Colton, Fontana, Loma Linda, Redlands, Rialto, Bloomington, Highland, Grand Terrace, and Yucaipa.

Groundwater, from the Colton, Rialto, Bunker Hill, Yucaipa, and San Timoteo Basins, is the principal local source of supply in SBVMWD's service area. Other sources of water supply include surface water from Lytle Creek, the Santa Ana River, and Mill Creek as well as imported SWP water.

SBVMWD's contract entitlement for SWP was 1,677 AF in 1972, the initial year of deliveries, and was increased to a maximum entitlement of 102,600 AF in 1991. The entitlement is the fifth largest of all SWP contractors.

A portion of Fontana Water Company's service area is within SBVMWD's service area and currently can receive up to 5,000 AFY of imported untreated SWP water from SBVMWD for use in that portion of Fontana Water Company's service area. Fontana Water Company has upgraded its existing Sandhill Water Treatment Plant to treat approximately 29 MGD of Lytle Creek surface water and SWP water. The Sandhill Plant will treat the imported untreated SWP water from the SBVMWD in addition to treating available Lytle Creek surface water and SWP water from IEUA. Fontana Water Company expects to receive greater quantities of SWP water from SBVMWD as population growth and development increase in the SBVMWD portion of Fontana Water Company's service area.

## **HISTORICAL WATER USES IN THE FONTANA WATER COMPANY'S SERVICE AREA**

Water uses in Fontana Water Company's service area can be attributed to the following four sectors:

- Residential and Commercial
- Industrial
- Public Authorities
- Construction

Table 10 summarizes historical annual water uses by the four sectors in Fontana Water Company's service area. From 1988 to 2008, annual water uses in Fontana Water Company's service area increased from approximately 26,320 AFY to 43,800 AFY, for an average increase of 874 AF per year. The average annual percentage increase was 2.8%. Of the total water use, the residential and commercial sector accounts for 82.9%, industrial accounts for 7.0%, public authority accounts for 9.0%, and construction accounts for 1.2%.

Lost and unaccounted for water from the Fontana Water Company water system during 2008 was estimated to be approximately 8%.

**TABLE 10 HISTORICAL ANNUAL WATER USES BY SECTORS**

| Year           | Residential and Commercial |              | Industrial |             | Public Authorities |             | Construction |             | Total  |                     |
|----------------|----------------------------|--------------|------------|-------------|--------------------|-------------|--------------|-------------|--------|---------------------|

## **4.0 FUTURE WATER DEMANDS IN THE FONTANA WATER COMPANY SERVICE AREA WITH THE PROJECT**

In addition to Fontana Water Company's UWMP, a comprehensive Water System Master Plan for Fontana Water Company was completed in April 2005 and updated in August 2008. The Water System Master Plan included water demand forecasts for Fontana Water Company's service area for the next twenty years as well as at build out. These demand forecasts do not distinguish any particular demand for any specific project, but identify total demand for Fontana Water Company's service area. The demand for the Project area addressed by this water supply assessment is included in the water demand forecast.

In the water demand forecasts, water users in Fontana Water Company's service area include four sectors: residential/commercial, industrial, public authorities, and construction. Water demand for each sector was estimated by multiplying the projected number of water service connections and unit water use per connection for the sector. Water conservation savings were estimated using the same percentage as the IEUA's 2005 Regional UWMP. Pursuant to new State legislation enacted in November 2009, Fontana Water Company will be developing updated water conservation goals of 15% by 2015 and 20% by 2020 as part of Fontana Water Company's updated UWMP to be completed by December 31, 2010.

Water demand within the project boundary includes industrial/commercial, warehouse, and residential uses. Industrial/commercial water demand is estimated by multiplying planned acreage by the water use rate of 2,200 gpd/acre derived from recorded water use data in industrial/ commercial areas within Fontana Water Company's service area. Warehouse water demand is estimated by multiplying planned acreage by the water use rate of 350 gpd/acre. Residential water demand is estimated by multiplying the number of planned dwelling units by the water use rate of 668 gpd/du derived from recorded residential water use data in FWC's service area. As indicated in Fontana Water Company's 2008 Water System Master Plan Update, the residential water use rate is based on recorded residential water use data from January 1988 to December 2007 in Fontana Water Company's service area. Since the Project will include both new development and redevelopment of existing water uses, the water demand for the Project would be the net change in water demand within the Project boundary. The estimated water demand for the Project in normal years is summarized in Table 11a. At buildout, the net annual water demand for the Project is estimated to be approximately 1,690 acre-ft per year.

The projected water demand in normal years for Fontana Water Company's service area including the Project during the next twenty years is summarized in Table 11b. Note that it is projected the Project will be completed in 2030 and the net change in annual water demand at buildout (1,690 AFY) of the Project is evenly distributed from 2010 to 2030 on an annual basis.

**TABLE 11a PROJECT WATER DEMAND ESTIMATE AT BUILDOUT**

|                  | <b>Total Net Change in Buildout SF</b> | <b>Net Change in Buildout SF of Warehouse</b> | <b>Net Change in Buildout SF of Industrial/Commercial</b> | <b>Net Change in Dwelling Units</b> | <b>Total Net Change in Water Demand</b> |
|------------------|----------------------------------------|-----------------------------------------------|-----------------------------------------------------------|-------------------------------------|-----------------------------------------|
| Square Footage   | 28,100,035                             | 12,523,064 <sup>1</sup>                       | 15,576,971 <sup>2</sup>                                   | -397 units                          |                                         |
| Floor Area Ratio | 50%                                    | 50%                                           | 50%                                                       |                                     |                                         |
| Land Use (acre)  | 1,290.2                                | 575.0                                         | 715.2                                                     |                                     |                                         |
| Water Use Rate   |                                        | 350 gpd/acre                                  | 2,200 gpd/acre                                            | 668 gpd/du                          |                                         |
| Water Demand     |                                        | 225 AFY                                       | 1,762 AFY                                                 | -297 AFY                            | <b>1,690 AFY</b>                        |

Notes:

- 1) Net change in buildout SF of warehouse is the sum of the proposed buildout warehouse SF.
- 2) Net change in buildout SF of industrial/commercial is estimated by subtracting the net change of warehouse (12,523,064 sf) from the total net change in buildout SF (28,100,035 sf).

**TABLE 11b FUTURE WATER DEMANDS IN FONTANA WATER COMPANY'S SERVICE AREA WITH THE PROJECT IN NORMAL YEARS (AFY)**

| Year                                                    |                                   | 2010          | 2015          | 2020          | 2025          | 2030          |
|---------------------------------------------------------|-----------------------------------|---------------|---------------|---------------|---------------|---------------|
| <b>Project Demand</b>                                   | <b>Net Change in Water Demand</b> | 0             | 420           | 850           | 1,270         | 1,690         |
| <b>Fontana Water Company Demand without the Project</b> |                                   | 49,300        | 54,680        | 59,450        | 64,230        | 69,010        |
| <b>Total Demand with the Project</b>                    |                                   | <b>49,300</b> | <b>55,100</b> | <b>60,300</b> | <b>65,500</b> | <b>70,700</b> |
| <b>Total Demand w/ Conservation</b>                     |                                   | <b>46,800</b> | <b>49,600</b> | <b>54,300</b> | <b>59,000</b> | <b>63,600</b> |

Note: It is projected the Project will be completed in 2030 and the net change in annual water demand at buildout (or 1,690 AFY) of the Project is evenly distributed from 2010 to 2030 on an annual basis.

## **5.0 FUTURE WATER SUPPLIES IN THE FONTANA WATER COMPANY SERVICE AREA**

Fontana Water Company's principal future water supplies for its service area are groundwater pumped from Chino Basin, Lytle Basin, Rialto Basin, and No-Man's Land, surface water from Lytle Creek, recycled water, and imported water from SBVMWD and IEUA. The following describes the potential yield from these sources.

### **LYTLE CREEK**

Fontana Water Company is entitled to divert up to 3,480.78 miner's inches (~50,400 AFY) from the Lytle Creek Region, including up to 2,500 miner's inches (~36,200 AFY) of combined surface and groundwater extractions to augment surface water diversions. Annual Lytle Creek flows from 1972 to 2008 based on United States Geological Survey (USGS) data are shown in Figure 5. USGS data from a Lytle Creek gaging station in the vicinity and upstream of Fontana Water Company's service area was used to determine the annual Lytle Creek flows. Based on USGS data, the driest three year period from 1972 to 2008 is the period 1988-1990. The flows for the period 1988-1990 are used in this Water Supply Assessment as the expected available water supply from Lytle Creek during a future multiple dry year period. Fontana Water Company's long-term average diversion of 7,000 AFY from Lytle Creek during normal years is used in this Water Supply Assessment as the expected surface water diversion available to Fontana Water Company during future normal years. However, Fontana Water Company's new Sandhill Water Treatment Plant upgrades will allow Fontana Water Company to divert much greater quantities of surface water flow in future years.

**FIGURE 5 HISTORICAL LYTLE CREEK FLOWS (1972 – 2008)**

Source: USGS 11062000 (Lytle C NR Fontana CA) gage station

## LYTLE BASIN

Fontana Water Company can pump and divert more than 18,800 AFY of groundwater from the Lytle Basin. However, the basin is subject to significant changes in groundwater elevation. This was demonstrated after the significant rainfall received in March of 1993. In the months following a series of storms during that very wet year, basin static water levels increased 200 feet in three months. This implies that basin static water levels could likewise decrease and thus affect groundwater production during sustained dry years. For the purpose of this Water Supply Assessment, Fontana Water Company's average groundwater production of approximately 11,000 AFY in normal years, will be available for pumping and

diversion by Fontana Water Company during normal years in the next twenty years. Fontana Water Company's average annual production of approximately 6,500 AFY during the historical drought period from 1988 to 1990 is estimated to be available during future multiple dry years.

#### **CHINO BASIN**

Fontana Water Company's average annual production from the Chino Basin from 1988 to 2008 was approximately 15,150 AFY. During the most recent three years, Fontana Water Company's average annual production was approximately 17,270 AFY. According to IEUA's 2005 Regional UWMP, total groundwater production in IEUA's service area in a normal year is estimated to increase from approximately 180,000 to 210,000 AFY by 2025 (see Table 7). The Chino Basin Judgment authorizes Fontana Water Company to produce all the water it requires from the Chino Basin for beneficial use by Fontana Water Company's public utility customers, subject to replenishment assessments, and more than ample water is present in the Chino Basin to allow Fontana Water Company to do so. Fontana Water Company will construct additional wells and associated infrastructure in the Chino Basin to match additional water demands with growth in its service area. Because of groundwater contamination in the Chino Basin from nitrate, perchlorate, and other substances, production of groundwater from affected wells may be interrupted until wellhead treatment is installed. Fontana Water Company has the necessary technical and financial resources available to allow Fontana Water Company to quickly respond to any such water quality incidents to assure continuity and reliability of water service.

#### **RIALTO BASIN**

Fontana Water Company and other pumpers subject to the 1961 Rialto Basin Decree are authorized to pump from the Rialto Basin without restriction, although extractions for any given year may be affected by the groundwater elevations in three key wells during March and May. Fontana Water Company's historical total groundwater production from the Rialto Basin is shown in Table 12.

From 1984 to 2000, average groundwater levels were close to or higher than 1,002.3 feet above MSL. It is reasonable to assume that 8,800 AFY, which is the average production

during a rainfall period corresponding to long-term rainfall averages, will be available for pumping by Fontana Water Company during normal years in the next twenty years. Fontana Water Company's historical annual production of approximately 2,000 AFY per well during the drought period from 1988 to 1990, which would equate to a total of approximately 8,000 AFY for the four wells currently located in the Rialto Basin, is estimated to be available during future droughts. In addition, Fontana Water Company has the right to pump an additional 1,600 AFY from the Rialto Basin pursuant to a "Standby Water Lease" agreement with the City of Rialto, if needed.

#### **NO-MAN'S LAND**

A US Bankruptcy Court confirmed Plan of Reorganization for FUWC allocated groundwater production from this basin and water production restrictions are not applicable. Based on available historical information about the basin, Fontana Water Company's average production of approximately 3,800 AFY, during a rainfall period corresponding to long-term rainfall averages, is expected to be available for pumping by Fontana Water Company during normal years in the next twenty years. Fontana Water Company's annual production of approximately 3,400 AFY, during the recent drought periods from 2000 to 2002 and from 2005 to 2008, is estimated to be available during future droughts.

#### **RECYCLED WATER**

Achieving maximum use of all available recycled water is one of Fontana Water Company's and IEUA's water management goals. Recycled water could be used for groundwater recharge and storage as well as direct use by customers who are equipped and able to use recycled water. Fontana Water Company strongly supports the use of recycled water and plans to provide recycled water to customers in its service area who are able to use it, when it is made available. In fact, San Gabriel Valley Water Company, of which Fontana Water Company is a division, presently serves recycled water to numerous customers in the Main San Gabriel Basin and Central Basin in Los Angeles County where San Gabriel Valley Water Company has commitments to deliver over 7,000 acre feet per year to customers in its service area.

In IEUA's "Recycled Water Facility Reports", dated September 2006, IEUA proposed construction of several recycled water lines throughout the City of Fontana,

including construction of 4,400 feet of a 48-inch diameter pipeline along Etiwanda Avenue and construction of 26,300 feet of 24-inch diameter pipeline in the southern portion of Fontana Water Company's service area.

Additional facilities will be required to accept delivery of recycled water from IEUA for delivery to Fontana Water Company's customers throughout the City of Fontana. These facilities will include additional pipelines, and possibly booster stations, and reservoirs. In addition, Fontana Water Company must make arrangements with the City of Fontana, the contracting agency with IEUA, to obtain available recycled water. The City of Fontana's "Feasibility Study to Serve Recycled Water in the City of Fontana" identifies recycled water needs in the southwestern portion of Fontana Water Company's service area. Fontana Water Company plans to design and construct a recycled water distribution system in the southwestern portion of its service area to meet those needs. Fontana Water Company anticipates delivering more than 1,700 AF of recycled water to schools, parks, and commercial customers, for irrigation and other uses. Recycled water will be provided by IEUA's Regional Water Recycling Plant 4. Construction of the phased project is scheduled to occur between 2010 and 2011.

**TABLE 12 HISTORICAL ANNUAL PRODUCTION FROM THE RIALTO BASIN (AFY)**

| <b>Year</b> | <b>Production by<br/>Fontana Water<br/>Company</b> |
|-------------|----------------------------------------------------|
| 1978        |                                                    |
| 1979        |                                                    |
| 1980        |                                                    |
| 1981        |                                                    |
| 1982        |                                                    |
| 1983        |                                                    |
| 1984        |                                                    |
| 1985        |                                                    |
| 1986        |                                                    |
| 1987        |                                                    |
| 1988        | 501                                                |
| 1989        | 2,328                                              |
| 1990        | 3,206                                              |
| 1991        | 3,555                                              |
| 1992        | 1,061                                              |
| 1993        | 2,320                                              |
| 1994        | 2,171                                              |
| 1995        | 2,111                                              |
| 1996        | 2,271                                              |
| 1997        | 2,596                                              |
| 1998        | 2,891                                              |
| 1999        | 2,935                                              |
| 2000        | 3,552                                              |
| 2001        | 6,106                                              |
| 2002        | 9,452                                              |
| 2003        | 9,321                                              |
| 2004        | 8,173                                              |
| 2005        | 7,252                                              |
| 2006        | 5,695                                              |
| 2007        | 5,493                                              |
| 2008        | 6,312                                              |

#### **IMPORTED WATER SUPPLIES**

As discussed previously, Fontana Water Company can purchase untreated SWP water from SBVMWD and imported water supplies from MWD (including Colorado River water,

SWP water, water storage, and water transfers) through IEUA. Fontana Water Company can currently purchase and receive up to 24,000 AFY of MWD imported SWP water from IEUA. Fontana Water Company can currently purchase up to 5,000 AFY of imported SWP water from SBVMWD and larger quantities as water use in the SBVMWD portion of Fontana Water Company's service area increases.

The SWP is a water storage and delivery system maintained and operated by the Department of Water Resources (DWR). MWD and SBVMWD hold long-term contracts with DWR for SWP water. MWD currently has a contractual 'Table A' amount of 1,911,500 AFY of SWP water ('Table A' represents the proportion of available SWP water allocated and delivered to each SWP contractor). SBVMWD currently has a contractual 'Table A' amount of 102,600 AFY of SWP water

State and federal resources and environmental protection agencies and a broad range of stakeholders have been involved in a multiyear planning process referred to as the CALFED process to develop programs to greatly improve the capacity and reliability of the SWP and the environmental conditions of the San Francisco Bay -Sacramento River Delta area (Bay-Delta). The Bay-Delta is a part of the SWP water delivery system. The Bay-Delta cooperating agencies approved a Record of Decision in August 2000 for a Programmatic Environmental Impact Report/Impact Statement for a multi-year improvement program. The improvement program includes projects related to SWP conveyance capacity, water quality, and operation of the SWP. Those programs are, of course, subject to environmental review and public input is required.

According to DWR's "The State Water Project Delivery Reliability Report 2007" (August 2008), the delivery reliability of SWP water is approximately 63 percent, on average, over the next 20 years. The DWR report incorporated future impacts on water deliveries as a result of climate change and potential limited pumping of the SWP to protect salmon, smelt, and other species in the Sacramento-San Joaquin Delta and Central Valley areas. The long term impact of these restrictions is not known in detail at this time. The US Department of the Interior recently announced a scientific review which could greatly alleviate the impacts of such restrictions on SWP deliveries. In addition, the Sierra Nevada watershed, source of much of the water for the SWP, has recently had consecutive critically dry years.

In response to these water supply conditions MWD has implemented its “Water Supply Allocation Plan” at a “Regional Shortage Level 2” for Fiscal Year 2009/2010 to reduce its wholesale water deliveries by ten percent. In addition, MWD has developed a “Five-Year Supply Plan” which includes various programs to enhance supplies through conservation, Colorado River transactions, SWP transactions, near-term Delta actions, groundwater recovery, and local resource enhancement programs. MWD staff reported at a June 2009 MWD Board of Directors Committee meeting that it is estimated MWD’s Calendar Year 2009 water demands will be approximately 2.05 million acre feet (AF) and MWD’s Calendar Year 2009 water supplies will approximately 2.16 million AF, resulting in approximately 0.11 million AF in surplus water for Calendar Year 2009. These estimates of water demand and supply include the anticipated water deliveries from the Colorado River and the SWP, use of water in storage in the MWD system and implementation of the Water Supply Allocation Plan and the Five-Year Supply Plan.

MWD is engaged in both short and long term efforts to address SWP water availability including implementation of the Five-Year Supply Plan which is anticipated to result in an additional 502,000 acre-feet per year of MWD water supplies by the year 2010 and an additional 602,000 to 808,000 acre-feet per year of MWD water supplies between 2011 and 2014, continuation or revision of the Water Supply Allocation Plan, participation in court challenges to the restrictions of pumping operations of the SWP, and participation in several planning programs to develop short term and long term improvements to the Sacramento-San Joaquin Delta and SWP water conveyance systems to reduce impacts on the ecosystem while allowing export of water through the SWP to meet future water demands.

MWD Replenishment Water, the category of water service used for groundwater replenishment with imported water in the Chino Basin, has been unavailable since May 2007 due to the current drought and limitations on SWP water availability. MWD has indicated that Replenishment Water may be available in approximately 3 out of 10 years in the future under current SWP operating conditions.

In addition, MWD is currently updating its Integrated Resources Plan to evaluate water supply availability considering the recent constraints discussed elsewhere in this Water Supply Assessment and develop a water resource strategy to meet future demands including anticipated replenishment demands. For the purpose of protecting and preserving the groundwater supplies within the Chino Basin, IEUA, the Chino Basin Watermaster

(CBWM), the Chino Basin Water Conservation District (CBWCD), and the San Bernardino County Flood Control District (SBCFCD) jointly sponsor the Chino Basin Recycled Water Groundwater Recharge Program. The program consists of infrastructure and pipelines that direct stormwater run-off, imported SWP water, and IEUA recycled water to groundwater recharge sites within the Chino Basin. The Chino Basin Recycled Water Groundwater Recharge Program will assist in mitigating future water shortages in California due to potential limits on imported SWP water.

### **Imported Water from SBVMWD**

Fontana Water Company can currently receive up to 5,000 AFY of imported water supplies from SBVMWD. Fontana Water Company expects to receive greater quantities of SWP water from SBVMWD as population and water use increase in the SBVMWD portion of Fontana Water Company's service area

The delivery reliability of SWP water from SBVMWD is similar to the previous discussion of SWP deliveries from IEUA and MWD except that for the foreseeable future, SBVMWD's contractual amount of 102,600 AFY of "Table A" SWP water is well in excess of pumping demands in the SBVMWD service area. Although Fontana Water Company expects to receive greater quantities of SWP water from SBVMWD in the future, it has been conservatively assumed that Fontana Water Company will receive up to 5,000 AFY of SWP water from SBMWD in the next twenty years. The reliability analysis in DWR's "The State Water Project Delivery Reliability Report 2007" shows that if Fontana Water Company can receive up to 5,000 AFY of SWP water during wet years from SBVMWD then Fontana Water Company can obtain approximately 3,150 AF (or 5,000 AFY x 63 percent), at least, during normal years, approximately 300 AF (or 5,000 AFY x 6 percent), at least, during a single dry year, and approximately 1,700 AF (or 5,000 AFY x 34 percent), at least, during multiple dry years. Imported water provided by SBVMWD will be treated at Fontana Water Company's Sandhill Water Treatment Plant, which is discussed in the following section on imported water from IEUA.

### **Imported Water from IEUA**

Fontana Water Company's upgraded Sandhill Water Treatment Plant can treat imported water from IEUA and SBVMWD and local surface water from Lytle Creek. The

Sandhill Water Treatment Plant, which has a capacity of up to 29 MGD, includes a 40 cfs (approximately 24,000 AFY) connection with IEUA to receive untreated SWP water. Based on IEUA's 2005 Regional UWMP, Fontana Water Company is projected to receive approximately 3 percent of IEUA's imported water supplies by the year 2010, and approximately 16 percent of IEUA's imported water supplies by the year 2025. The new source will allow Fontana Water Company greater flexibility in managing its water supply sources both short and long term, as well as in normal and dry years. Also, the upgraded surface water treatment plant allows Fontana Water Company to treat and maximize the use of turbid Lytle Creek storm water flows that could not be used in the past.

## **WATER SUPPLY SUMMARY**

Based on the above discussion of the available water supply sources, the water supply-demand balance in Fontana Water Company's service area in normal, single dry, and multiple dry years during the next twenty years are summarized in Table 13, Table 14, and Table 15.

The Chino Basin is an important source of groundwater for Fontana Water Company now and will continue to be in the future. In addition, the Chino Basin Watermaster's Optimum Basin Management Program will greatly increase the basin's safe yield through recharge of imported water, additional local storm water, and recycled water. Fontana Water Company will increase its dry year production from the Chino Basin. Based on pump capacity information from the Fontana Water Company's 2008 Water System Master Plan Update, Fontana Water Company's Chino Basin wells have a total pumping capacity of approximately 29,082 gpm (~46,910 AFY). Based on the Master Plan Update, Fontana Water Company is planning to increase its pumping capacity in the Chino Basin through construction of four additional new 2,000 gpm wells in the near future, with a total expected capacity of approximately 8,000 gpm (~12,900 AFY). Fontana Water Company is also planning to construct four new wells to replace four existing wells, which will provide a net increase in production of approximately 2,560 gpm (~4,130 AFY) of additional capacity over existing capacity. In addition, Fontana Water Company plans to install wellhead treatment on existing Chino Basin wells to remove perchlorate contamination and restore

approximately 6,500 gpm (~10,480 AFY) of groundwater production capacity. The Water System Master Plan Update also recommends that Fontana Water Company install at least three additional 2,000 gpm wells, or a total capacity of approximately 6,000 gpm (~9,680 AFY), to provide water supply in case of emergency interruptions of water service due to migration of contamination, loss of power, physical damage to electrical power supply equipment, or failure of a water transmission pipeline. Fontana Water Company's total pumping capacity from the Chino Basin will be approximately 52,142 gpm, or approximately 84,100 AFY (46,910 AFY + 12,900 AFY + 4,130 AFY + 10,480 AFY + 9,680 AFY) after the new wells, replacement wells, and the required wellhead treatment facilities have been constructed.

Tables 13, 14 and 15 show that the water supplies available to Fontana Water Company will be sufficient to meet all present and future water supply requirements in Fontana Water Company's service area with the Project for at least the next twenty years.

**TABLE 13 FUTURE WATER SUPPLIES IN FONTANA WATER COMPANY'S SERVICE AREA IN  
NORMAL YEARS (AFY)**

| Year                                                 |                            | 2010   | 2015   | 2020   | 2025   | 2030   |
|------------------------------------------------------|----------------------------|--------|--------|--------|--------|--------|

|                                                      | Imported Water from IEUA   | 18,000         | 2,000                           | 2,000                           | 2,000         | 2,000         |
|                                                      | <b>Total</b>               | 76,400         | 83,700                          | 83,700                          | 80,400        | 78,100        |
| <b>Surplus Water Supplies (without Conservation)</b> |                            | 27,100         | 32,700                          | 32,700                          | 26,900        | 26,500        |

*1) Based on Fontana Water Company's historical water uses during the identified multiple dry years (1988-1990), it is estimated that a single dry year water demand is about 3.5% higher than normal year demand, dry year 2 demand is about 4.8% higher than dry year 1 demand, while dry year 3 demand is about 3.5% lower than dry year 2 demand.*

## 1.0 INTRODUCTION

The following study represents the Hydrology and Water Quality Technical Appendix prepared as part of the *Fontana Southwest Industrial Park (SWIP) Specific Plan*. The SWIP project site is generally bounded by I-10 to the north, Philadelphia Avenue to the south, Citrus Avenue to the east and Etiwanda Avenue to the west in the City of Fontana, San Bernardino County, California (See **Figures 1 and 2** for a Regional and Project Vicinity Map). The project site encompasses approximately 3100 acres. This report is a technical engineering evaluation intended to support the *Master Planning and Infrastructure Program* for the SWIP Specific Plan project on issues related to drainage, surface hydrology, and water quality.

The project consists of the revitalization of South Fontana. The proposed project involves industrial, commercial, and residential redevelopment.

All assessments and technical analyses in this report are in compliance with the local drainage policies and requirements for the City of Fontana, Santa Ana Regional Water Quality Control Board (SARWQCB), San Bernardino County, and the California Environmental Quality Act (CEQA) of 1970, as amended. The hydrology analysis and drainage assessments have been prepared at a preliminary engineering level based upon available information. No detailed hydrology or hydraulics modeling has been performed.

### 1.1 Background and History

Currently, the existing SWIP boundary is approximately 1845 acres. The project area is currently zoned for light and general industrial land uses. The proposed Fontana Southwest Industrial Park (SWIP) project would expand the existing boundary to approximately 3100 acres. Surrounding neighborhoods include the Southridge Specific Plan to the South, the Fontana Gateway Specific Plan to the west and Light industrial and General Industrial to the north, east and west. The SWIP Specific Plan will address land use compatibility issues ensuring that a more cohesive development pattern is achieved.

Federal, state and local drainage laws and regulations govern the evaluation of impacts to surface water drainage. For this evaluation, impacts to surface water drainage would be considered significant if the project alters the drainage patterns of the site, which would result in substantial erosion, siltation, or increase runoff that would result in increased flooding. An increase in the amount of runoff could be considered a significant cause of erosion due to the concentration of flows.

The City of Fontana has been designated a regulated Small Municipal Storm Sewer System (MS4) by the United States Environmental Protection Agency (USEPA) pursuant to 40 CFR§122.32(a) (1) because it is an urbanized area as defined by the Bureau of Census. Therefore, the City is required to comply with the Phase II regulations of the National Pollutant Discharge Elimination System (NPDES). There are two options. One is to obtain an individual permit addressing specific compliance provisions and the other is to file a Notice of Intent (NOI) to comply with the State Water Resources Board (SWRB) Small MS4 General Permit.

This permit regulates urban storm water runoff from areas under the jurisdiction of the permittees, including storm water runoff, snowmelt runoff, and surface runoff and drainage flow into the Santa Ana River and its tributaries.

To implement its obligations, City of Fontana has adopted a Municipal Storm Water Management Plan (MSWMP), which consists of a variety of measures, including prohibition or regulation of specific types of discharges, inspections, avoidance of sewage spills, public education, controls on new development and redevelopment, site maintenance practices and construction site management practices.

City of Fontana is a co-permittee for the Area-wide Urban Storm Water Permit, issued by the Santa Ana River Water Quality Control Board (SARWQCB) pursuant to the National Pollution Discharge Elimination System (NPDES) program under Section 402(p) of the federal Clean Water Act. This permit is referred as NPDES No. CAS618036/Order No. R8-2002-0012.

Dischargers whose projects disturb one or more acres of soil or whose projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity. Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility.

The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP should contain a site map(s) which shows the construction site perimeter, existing and proposed buildings, lots, roadways, storm water collection and discharge points, general topography both before and after construction, and drainage patterns across the project. The SWPPP must list Best Management Practices (BMPs) the discharger will use to protect storm water runoff and the placement of those BMPs. Additionally, the SWPPP must contain a visual monitoring program; a chemical monitoring program for "non-visible" pollutants to be implemented if there is a failure of BMPs; and a sediment monitoring plan if the site discharges directly to a water body listed on the 303(d) list for sediment.

## **1.2 Development Planning for Storm Water Management**

The requirement to implement a program for development planning was based on federal and state statutes including (Section 402 9p) of the Clean Water Act and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from the storm water conveyance system to the "Maximum Extent Practicable".

For this evaluation, impacts to storm water quality would be considered significant if the project did not attempt to address storm water pollution to the maximum extent practicable. Currently, there are no definitive water quality standards for individual pollutants. Therefore, impacts to storm water quality would be considered less than significant if they meet the requirements of the WQMP.

The Storm Water Quality Management Plan (SWQMP) requirements for commercial/institutional developments include the following:

1. Post development peak storm discharge rates shall not exceed the estimated pre-development rate for developments where increased peak storm water discharge rate would result in increased potential for downstream erosion.
2. Conserve natural areas by using cluster development, limiting clearing and grading of native vegetation, maximize trees and other vegetation, promote natural vegetation, and preserve riparian area and wetlands.
3. Minimize storm water pollutants of concern by incorporating BMPs or combinations of BMPs best suited to maximize the reduction of pollutant loadings in runoff to the maximum extent practicable.
4. Protect slopes and channels to decrease the potential for erosion and the subsequent impacts to storm water runoff.
5. Provide storm drain system stenciling and signage.
6. Properly design outdoor material storage areas.
7. Properly design trash storage areas.
8. Provide proof of ongoing BMP maintenance.
9. Comply with SUSMP standards for design of structural or treatment control BMPs.
10. Properly design loading/unloading dock areas.
11. Properly design repair/maintenance bays.
12. Properly design vehicle/equipment wash areas.
13. Design parking areas to reduce impervious land coverage in order to encourage the infiltration and treatment of runoff before it enters the storm drain system.

**Figure 2 – Project Vicinity Map**

## 2.0 EXISTING CONDITIONS

### 2.1 City of Fontana Master Plan of Drainage

In 1992 the City of Fontana developed a Master Plan of Drainage for the entire City and the Fontana Sphere of Influence. The study was divided into several areas with additional sub-drainage areas. The drainage areas include; Area North of 1-15, North Fontana, South Fontana, Project 3-3 and Project 3-4. The Southwest Industrial Park (SWIP) lies in the South Fontana Drainage Area. This drainage area is located southerly of the West Fontana Channel and northerly of the ridge line of the Jurupa Mountains. This area drains to the San Sevaine Channel via the I-10 channel and the Declez Chanel and major storm drains in Randall Avenue, San Bernardino Avenue and Valley Boulevard. Several smaller storm drains join the San Sevaine Channel directly.

There are existing reinforced concrete pipe (RCP) storm drains in both Beech and Hemlock Avenue that extend south from Slover Avenue to Jurupa Avenue that drain to Declez Channel. The South Fontana Master Strom Drain Plan Exhibit prepared by Hall & Foreman, Inc shows proposed storm drain facilities along Calabash Ave, Banana Ave, Almond Ave, Cherry Ave, Redwood Ave and Live Oak Ave (DZ Drainage System). The exhibit is included in **Appendix A**. The size alignment and configuration of storm drain shown on the exhibit are conceptual. The cost estimate for construction of the DZ drainage system was approximately 5 million (1992).

The MPD storm facilities are planned for 25-year storm events and the combination of the storm drain facilities and the street drainage capacity will provide the required 100-year flood protection.

Currently the City of Fontana has a development fee schedule. The City currently charges \$4,998 per net acre of residential, commercial and industrial for storm drain development. Storm water compliance fee ranges from \$350 to \$1,400 (depending on the size of the project) for all new construction inspection.

### 2.2 Existing Land Use

The City of Fontana established drainage pattern is street flow and some storm drain in a south west direction towards the San Sevaine and Declez Flood Control facilities which are owned and maintained by San Bernardino County Flood Control District (SBCFCD).

The Southwest Industrial Park (SWIP) area consists of a mixture of industrial, commercial, and residential land uses. Refer to **Table 2.1** and **Figure 3** for a detailed existing land use distribution. The existing land use distribution is consistent with the General Plan (2003).

**Figure 3 – Existing Land Use Map**

## 2.3 Hydrologic Parameters

An existing conditions qualitative analysis was prepared for the project area. Hydrologic parameter calculations to evaluate impacts from the existing condition which is consistent with the general plan update (2003) were evaluated based on a comparison of tributary area, and proposed change in percent impervious.

The type of land use and vegetation or ground cover affects the infiltration rate. Impervious values were determined using *San Bernardino County Hydrology Manual*. **Table 2.2** provides a summary of the land uses and the corresponding impervious values used for the analysis.

| <b>Table 2.2 – Percent Impervious Values</b> |                                  |                         |

Drainage patterns were determined using information obtained from existing Master Plan of Drainage (1992) and USGS quad maps.

### 2.3.1 Existing Watershed Description

The Specific Plan Area does not currently have a system of organized storm drain facilities. There are reinforced concrete pipe (RCP) storm drains in both Beech and Hemlock Avenue that extend south from Slover Avenue to 1,300 feet north of Jurupa Avenue. The Southwest Industrial Park lies in the South Fontana Drainage area as shown on the Master Plan of Drainage. Most of the study area drains to the Declez Channel via storm drain facilities. A portion of the study area drains to the San Sevaine Channel via existing storm drain system.

San Sevaine Channel lies on the west end of the specific plan area. It provides drainage for the San Gabriel Mountains and a substantial part of the city north of 1-10 freeway. The channel is improved where it traverses the Southwest Industrial Park Plan Area. A small part of the Southwest Industrial Park Specific Plan area is within a FEMA flood zone AE. Zone AE is an area with a 1% (100-yr flood) chance of flooding and the Base Flood Elevations (BFE) have been determined from detailed analyses.

The Declez Channel generally follows the base of the Jurupa Mountains on the north slope. The channel is fully improved and discharges to the San Sevaine Channel approximately one mile south of the City of Fontana, in Riverside County.

In many areas, City streets are designed to accommodate 25-year storm flows within the right-of-way. **Table 2.3** provides the existing condition area characteristics. In order to simplify comparison of the existing and proposed specific plan land uses, the SWIP area was divided into 17 sub areas (within 4 watersheds; A, B, C, D) in order to compare land use characteristics between the alternatives. In most cases the area represents the tributary area to the existing storm drain facility. The sub areas were delineated using the existing Master Plan of Drainage and USGS quad map. The areas listed correspond with **Figure 4**. The existing City flood control structures are also shown on Figure 4.

**Note:** % Impervious was based on area average.  
Land use was based on existing build out infrastructure.

The existing condition SWIP area consists of residential, industrial and commercial land uses. This study is intended only as a planning level investigation to determine proposed land use alternative project impacts to hydrology and water quality.

**Figure 4 – Existing Condition Drainage Map**

## **2.4 Floodplain Mapping**

The City of Fontana is a participant in the National Flood Insurance Program (NFIP). Communities participating in the NFIP must adopt and enforce minimum floodplain management standards, including identification of flood hazards and flooding risks. Participation in the NFIP allows communities to purchase low cost insurance protection against losses from flooding.

Most of the study area is outside the 1% chance (100-year) flooding. However, certain portions of the study limits are within the floodway and lie in Zone AE, whose base flood elevations are determined. **Figure 5** shows the FEMA flood zones for the SWIP study area.

**Figure 5 – FEMA Flood Zones**

## **2.5 Storm Water Quality**

As indicated in Section 1.2, storm water quality is a significant concern in Southern California. This section discusses typical pollutants found in storm water runoff and discusses the types of contaminants that may be found in existing storm water runoff.

### **2.5.1 Nonpoint Source Pollutants**

A net effect of urbanization can be to increase pollutant export. However, an important consideration in evaluating storm water quality from the project is to assess if it impairs the beneficial use to the receiving waters. Nonpoint source pollutants have been characterized by the following major categories in order to assist in determining the pertinent data and its use. Receiving waters can assimilate a limited quantity of various constituent elements, however there are thresholds beyond which the measured amount becomes a pollutant and results in an undesirable impact. Background of these standard water quality categories provides an understanding of typical urbanization impacts.

*Sediment* - Sediment is made up of tiny soil particles that are washed or blown into surface waters. It is the major pollutant by volume in surface water. Suspended soil particles can cause the water to look cloudy or turbid. The fine sediment particles also act as a vehicle to transport other pollutants including nutrients, trace metals, and hydrocarbons. Construction sites are typically the largest source of sediment for urban areas under development.

*Nutrients* - Nutrients are a major concern for surface water quality. Phosphorous and nitrogen are of special concern because they can cause algal blooms and excessive vegetative growth. Of the two, phosphorus is usually the limiting nutrient that controls the growth of algae in lakes. The orthophosphorous form of phosphorus is readily available for plant growth. The ammonium form of nitrogen can also have severe effects on surface water quality. The ammonium is converted to nitrate and nitrite forms of nitrogen in a process called nitrification. This process consumes large amounts of oxygen, which can impair the dissolved oxygen levels in water. The nitrate form of nitrogen is very soluble and is found naturally at low levels in water. When nitrogen fertilizer is applied to lawns or other areas in excess of plant needs, nitrates can leach below the root zone, eventually reaching ground water. Orthophosphate from auto emissions also contributes phosphorus in areas with heavy automobile traffic. As a general rule of thumb, nutrient export is greatest from development sites with the most impervious areas. Other problems resulting from excess nutrients are 1) surface algal scums, 2) water discolorations, 3) odors, 4) toxic releases, and 5) overgrowth of plants. Common measures for nutrients are total nitrogen, organic nitrogen, total Kjeldahl nitrogen (TKN), nitrate, ammonia, total phosphate, and total organic carbon (TOC).

*Trace Metals* - Trace metals are primarily a concern because of their toxic effects on aquatic life and their potential to contaminate drinking water supplies. The most common trace metals found in urban runoff are lead, zinc, and copper. Fallout from automobile emissions is also a major source of lead in urban areas. A large fraction of the trace metals in urban runoff are attached to sediment and this effectively reduces the level, which is immediately available for biological uptake and subsequent bioaccumulation. Metals associated with the sediment settle out rapidly and accumulate in the soils. Also, urban runoff events typically occur over a shorter duration, which reduces the amount of exposure, which could be toxic to the aquatic environment. The toxicity of trace metals in runoff varies with the hardness of the receiving water. As total hardness of the water increases, the threshold concentration levels for adverse effects increases.

*Oxygen-Demanding Substances* - Aquatic life is dependent on the dissolved oxygen (DO) in the water and when organic matter is consumed by microorganisms then DO is consumed in the process. A rainfall event can deposit large quantities of oxygen demanding substance in lakes and streams. The biochemical oxygen demand of typical urban runoff is on the same order of magnitude as the effluent from an effective secondary wastewater treatment plant. A problem from low DO results when the rate of oxygen-demanding material exceeds the rate of replenishment. Oxygen demand is estimated by direct measure of DO and indirect measures such as biochemical oxygen demand (BOD), chemical oxygen demand (COD), oils and greases, and total organic carbon (TOC).

*Bacteria* - Bacteria levels in undiluted urban runoff exceed public health standards for water contact recreation almost without exception. Studies have found that total coliform counts exceeded EPA water quality criteria at almost every site and almost every time it rained. The coliform bacteria that are detected may not be a health risk in them, but are often associated with human pathogens.

*Oil and Grease* - Oil and grease contain a wide variety of hydrocarbons some of which could be toxic to aquatic life in low concentrations. These materials initially float on water and create the familiar rainbow-colored film. Hydrocarbons have a strong affinity for sediment and quickly become absorbed to it. The major source of hydrocarbons in urban runoff is through leakage of crankcase oil and other lubricating agents from automobiles. Hydrocarbon levels are highest in the runoff from parking lots, roads, and service stations. Residential land uses generate less hydrocarbons export, although illegal disposal of waste oil into storm waters can be a local problem.

*Other Toxic Chemicals* - Priority pollutants are generally related to hazardous wastes or toxic chemicals and can be sometimes detected in storm water. Priority pollutant scans have been conducted in previous studies of urban runoff, which evaluated the presence of over 120 toxic chemicals and compounds. The scans rarely revealed toxins that exceeded the current safety criteria. The urban runoff scans were primarily conducted in suburban areas not expected to have many sources of toxic pollutants (with the possible exception of illegally disposed or applied household hazardous wastes). Measures of priority pollutants in storm water include - 1) phthalate (plasticizer compound), 2) phenols and creosols (wood preservatives), 3) pesticides and herbicides, 4) oils and greases, and 5) metals.

### **2.5.2 Physical Characteristics of Surface Water Quality**

Standard parameters, which can assess the quality of storm water, provide a method of measuring impairment. A background of these typical characteristics assists in understanding water quality requirements. The quantity of a material in the environment and its characteristics determine the degree of availability as a pollutant in surface runoff. In an urban environment, the quantity of certain pollutants in the environment is a function of the intensity of the land use. For instance, a high density of automobile traffic makes a number of potential pollutants (such as lead and hydrocarbons) more available. The availability of a material, such as a fertilizer, is a function of the quantity and the manner in which it is applied. Applying fertilizer in quantities that exceed plant needs leaves the excess nutrients available for loss to surface or ground water.

The physical properties and chemical constituents of water traditionally have served as the primary means for monitoring and evaluating water quality. Evaluating the condition of water through a water quality standard refers to its physical, chemical, or biological characteristics. Water quality parameters for storm water comprise a long list and are classified in many ways. In many cases, the concentration of an urban pollutant, rather than the annual load of that pollutant, is needed to assess

a water quality problem. Some of the physical, chemical or biological characteristics that evaluate the quality of the surface runoff are outlined below:

*Dissolved Oxygen* - Dissolved oxygen in the water has a pronounced effect on the aquatic organisms and the chemical reactions that occur. It is one of the most important biological water quality characteristics in the aquatic environment. The dissolved oxygen concentration of a water body is determined by the solubility of oxygen, which is inversely related to water temperature, pressure, and biological activity. Dissolved oxygen is a transient property that can fluctuate rapidly in time and space. Dissolved oxygen represents the status of the water system at a particular point and time of sampling. The decomposition of organic debris in water is a slow process and the resulting changes in oxygen status respond slowly also. The oxygen demand is an indication of the pollutant load and includes measurements of biochemical oxygen demand or chemical oxygen demand.

*Biochemical Oxygen Demand (BOD)* - The biochemical oxygen demand (BOD) is an index of the oxygen-demanding properties of the biodegradable material in the water. Samples are taken from the field and incubated in the laboratory at 20°C, after which the residual dissolved oxygen is measured. The BOD value commonly referenced is the standard 5-day values. These values are useful in assessing stream pollution loads and for comparison purposes.

*Chemical Oxygen Demand* - The chemical oxygen demand (COD) is a measure of the pollutant loading in terms of complete chemical oxidation using strong oxidizing agents. It can be determined quickly because it does not rely on bacteriological actions as with BOD. COD does not necessarily provide a good index of oxygen demanding properties in natural waters.

*Total Dissolved Solids (TDS)* - TDS concentration is determined by evaporation of a filtered sample to obtain residue whose weight is divided by the sample volume. The TDS of natural waters varies widely. There are several reasons why TDS is an important indicator of water quality. Dissolved solids affect the ionic bonding strength related to other pollutants such as metals in the water. TDS are also a major determinant of aquatic habitat. TDS affects saturation concentration of dissolved oxygen and influences the ability of a water body to assimilate wastes. Eutrophication rates depend on total dissolved solids.

*pH* - The pH of water is the negative log, base 10, of the hydrogen ion ( $H^+$ ) activity. A pH of 7 is neutral; a pH greater than 7 indicates alkaline water; a pH less than 7 represents acidic water. In natural water, carbon dioxide reactions are some of the most important in establishing pH. The pH at any one time is an indication of the balance of chemical equilibrium in water and affects the availability of certain chemicals or nutrients in water for uptake by plants. The pH of water directly affects fish and other aquatic life and generally toxic limits are pH values less than 4.8 and greater than 9.2.

*Alkalinity* - Alkalinity is the opposite of acidity, representing the capacity of water to neutralize acid. Alkalinity is also linked to pH and is caused by the presence of carbonate, bicarbonate, and hydroxide, which are formed when carbon dioxide is dissolved. A high alkalinity is associated with a high pH and excessive solids. Most streams have alkalinities less than 200 mg/l and ranges of alkalinity of 100-200mg/l seem to support well-diversified aquatic life.

*Specific Conductance* - The specific conductivity of water, or its ability to conduct an electric current, is related to the total dissolved ionic solids. Long term monitoring a project waters can develop a

relationship between specific conductivity and TDS. Its measurement is quick and inexpensive and can be used to approximate TDS. Specific conductivities in excess of 2000  $\mu\text{ohms/cm}$  indicate a TDS level too high for most freshwater fish.

*Turbidity* - The clarity of water is an important indicator of water quality that relates to the ability of photosynthetic light to penetrate. Turbidity is an indicator of the property of water that causes light to become scattered or absorbed. Suspended clays and other organic particles cause turbidity. It can be used as an indicator of certain water quality constituents such as predicting the sediment concentrations.

*Nitrogen (N)* - Sources of nitrogen in storm water are from the additions of organic matter to water bodies or chemical additions. Ammonia and nitrate are important nutrients for the growth of algae and other plants. Excessive nitrogen can lead to eutrophication since nitrification consumes dissolved oxygen in the water. Nitrogen occurs in many forms. Organic Nitrogen breaks down into ammonia, which eventually becomes oxidized to nitrate-nitrogen, a form available for plants. High concentrations of nitrate-nitrogen (N/N) in water can stimulate growth of algae and other aquatic plants, but if phosphorus (P) is present, only about 0.30 mg/l of nitrate-nitrogen is needed for algal blooms. Some fish life can be affected when nitrate-nitrogen exceeds 4.2 mg/l. There are a number of ways to measure the various forms of aquatic nitrogen. Typical measurements of nitrogen include Kjeldahl nitrogen (organic nitrogen plus ammonia); ammonia; nitrite plus nitrate; nitrite; and nitrogen in plants. The principal water quality criteria for nitrogen focus on nitrate and ammonia.

*Phosphorus (P)* - Phosphorus is an important component of organic matter. In many water bodies, phosphorus is the limiting nutrient that prevents additional biological activity from occurring. The origin of this constituent in urban storm water discharge is generally from fertilizers and other industrial products. Orthophosphate is soluble and is considered to be the only biologically available form of phosphorus. Since phosphorus strongly associates with solid particles and is a significant part of organic material, sediments influence concentration in water and are an important component of the phosphorus cycle in streams. The primary methods of measurement include detecting orthophosphate and total phosphorus.

### **2.5.3 Existing Storm Water Quality**

The project site lacks any measured data on storm water runoff quality. In the absence of site-specific data, expected storm water quality can be qualitatively discussed by relating typical pollutants to specific land uses.

The SWIP Specific Plan area lies within Santa Area River, Reach 3. This reach has been listed on the 2006 CWA Section 303(d) list with the main pollutant being Pathogens.

Currently, the SWIP area contains industrial buildings, commercial buildings, and residential dwellings. The expected existing pollutants in the existing condition storm water runoff from the developed areas of Fontana are oil and grease from automobile use. Pollutants associated with residential, commercial and industrial development include trash, heavy metals, nutrients, bacteria, oil and grease, and household hazardous wastes.

### 3.0 PROPOSED PROJECT

A qualitative analysis was performed to determine the impacts on hydrology, floodplain mapping and water quality for the SWIP project. To evaluate the impacts of the land use alternatives for the project area, the analysis was based on a comparison of tributary area, and proposed change in percent impervious over the existing general plan.

#### 3.1 Proposed Land Uses

The proposed project would consist of a combination of new uses, expansion of certain existing uses and rehabilitation of the existing industrial areas. The proposed land use concept was categorized into 8 districts. **Figure 6** shows the proposed land use. **Table 3.1** provides a detailed breakdown of the proposed land use.

| Table 3.1 – Proposed Condition Land Use Distribution |                       |               |            |
|------------------------------------------------------|-----------------------|---------------|------------|
| Buildout Summary                                     |                       |               |            |
| District                                             | Land Use              | Area (sq. ft) | Area (ac.) |
| Freeway Industrial Commercial                        | Commercial - Retail   | 1,638,793     | 35.65      |

**Figure 6 – Proposed Land Use Map**

### 3.2 Hydrologic Parameters

Proposed evaluation for the different land uses were analyzed in a similar manner to the existing condition i.e. comparison of tributary area, and proposed change in percent impervious. Hydrologic parameter used in the analysis, such as impervious values for the land uses, is presented in the *San Bernardino County Hydrology Manual*. Refer to Table 2-2 for the land uses and impervious values used in this study.

#### 3.2.1 Proposed Watershed Description

Development within the SWIP area will alter the natural drainage that currently exists. This would occur as a result of the improvements of streets and the impervious surface created by parking lots and building within the developed areas.

For this analysis it was assumed that the proposed watershed would be the same as the existing. The drainage pattern for the areas flows generally to the south towards the San Sevaine and Declez Channel. Storm flow conveyance in the project area is generally within the existing streets. The hydrology parameters evaluation presented here is meant to show net changes as a result of the proposed specific plan only and not a full hydrologic analysis. A more detailed analysis would be required to assess exact facility impacts. **Table 3.2** shows the area characteristics for the proposed condition. The areas listed correspond with **Figure 7**.

| <b>Table 3.2 – Proposed Conditions Percent Impervious</b> |                   |                      |
|-----------------------------------------------------------|-------------------|----------------------|

| 5B                                                        | 74.29             | 0.63                 |
| 6B                                                        | 41.71             | 0.63                 |
| 1C                                                        | 144.37            | 0.90                 |
| 1D                                                        | 48.98             | 0.87                 |

The areas and the composite impervious values for the proposed condition were compared to the existing condition analysis to identify any impacts on the drainage facilities due to the proposed Fontana Southwest Industrial Park (SWIP) Area.

**Figure 7 – Proposed Condition Drainage Map**

### **3.3 Floodplain Mapping**

Portions of the SWIP area lies in zones identified as having a 1% chance of flooding and whose base flood elevations (BFE) have been identified. These areas include area 1B and 3B. Mitigation measures are discussed in **Section 4.3**

### **3.4 Storm Water Quality**

The general water quality of the project site is expected to deteriorate as a result of the proposed project. This is due to the proposed increase in impervious area. **Section 4.0** details the proposed mitigation to address future and existing water quality issues in the Fontana SWIP Specific Plan area.

#### 4.0 PROPOSED IMPACTS AND SUGGESTED MITIGATION

Mitigation would reduce impacts as a result of the development and revitalization of City of Fontana and the approved Sphere of Influence. The following section discusses both storm water conveyance and storm water quality mitigation measures.

##### 4.1 Hydrologic and Hydraulic Impacts

The Southwest Industrial Park Specific Plan project would result in an increase in the amount of impervious areas for the proposed land use. **Table 4.1** shows the area average imperviousness for each condition and the percent increase for the existing and proposed land uses for SWIP area. The potential for hydrologic impacts of the proposed project would require mitigation. The majority of the flows may be contained in the streets; however a storm drain system maybe needed at certain locations to carry the runoff and avoid flooding the neighborhoods.

The hydrologic parameter comparison of the percentage impervious presented here is meant to show expected net changes as a result of the SWIP project. A more detailed analysis would be required to assess exact facility impacts. In order to mitigate the additional runoff due to increase imperviousness within the SWIP area, implementation of the MPD is recommended.

| Table 4.1 – Comparison Area Characteristics |                       |                          |            |
|---------------------------------------------|-----------------------|--------------------------|------------|
| Area                                        | Exist - Impervious, C | Proposed – Impervious, C | % Increase |
| 1A                                          | 0.52                  | 0.76                     | 31.45      |
| 2A                                          | 0.51                  | 0.80                     | 36.42      |
| 3A                                          | 0.50                  | 0.81                     | 38.38      |
| 4A                                          | 0.49                  | 0.83                     | 41.20      |
| 5A                                          | 0.49                  | 0.83                     | 41.29      |
| 6A                                          | 0.48                  | 0.83                     | 41.53      |
| 7A                                          | 0.52                  | 0.80                     | 34.52      |
| 8A                                          | 0.55                  | 0.87                     | 36.49      |
| 9A                                          | 0.56                  | 0.88                     | 36.53      |
| 1B                                          | 0.54                  | 0.63                     | 14.29      |
| 2B                                          | 0.54                  | 0.63                     | 14.29      |
| 3B                                          | 0.54                  | 0.63                     | 14.29      |
| 4B                                          | 0.54                  | 0.63                     | 14.29      |
| 5B                                          | 0.54                  | 0.63                     | 14.29      |
| 6B                                          | 0.54                  | 0.63                     | 14.29      |
| 1C                                          | 0.71                  | 0.90                     | 21.11      |
| 1D                                          | 0.56                  | 0.87                     | 35.63      |

The results of this analysis indicate that there is an overall average increase of 28.25% in percent impervious due to the proposed SWIP project.

This increase in imperviousness will lead to increase runoff within the City of Fontana and may require mitigation to avoid impacting the existing storm drain and flood control facilities. Detailed analysis during the tentative map preparations would determine the need for mitigation. Mitigation may include detention or retention basins and additional storm drains within the existing streets. The

basins can be designed on either a local or regional basis to control peak flows depending on the capacity of the existing offsite facilities (Declez Channel and San Sevaine Channel). The storm drain system is discussed in **Section 5.0**.

#### **4.2 Floodplain Impacts**

Development occurring in the FEMA Flood zones and floodway identified in the proposed condition would be required to meet FEMA standards referenced in the City of Fontana's Municipal Code. Encroachments shall be prohibited, including fill, new construction, substantial improvements and other new developments within a floodway. Proposed development occurring within a floodplain will require a Conditional Letter of Map Revision (CLOMR) to be filed with the Federal Insurance Administrator. Upon completion of the proposed encroachments FEMA will issue a Letter of Map Revision (LOMR).

#### **4.3 Water Quality Impacts**

The SWIP Specific Plan within the City of Fontana would increase in impervious areas, resulting in impacts to storm water quality. The project could affect pollutant loading within the San Sevaine and Declez Channel. Mitigation for water quality impacts is recommended following the guidelines from the MSWMP. The following sections describe recommended Best Management Practices (BMP's) for the proposed project.

City of Fontana has adopted a Municipal Storm Water Management Plan (MSWMP), which consists of variety of measures. The City requires

- A National Pollution Discharge Elimination System (NPDES) General Construction Permit must be obtained from SARWQCB for construction projects involving a ground disturbance of at least 1 acre.
- Applicants shall prepare and submit a Notice of Intent (NOI) to comply with the Construction General Permit to the California State Water Resources Board.
- All dischargers must prepare, retain at the Construction site, and implement a Storm Water Pollution Prevention Plan (SWPPP) prior to issuance of a grading permit.
- A Storm Water Quality Management Plan (SWQMP) must be approved prior to any issuance of building permits. SWQMP specifies the Best Management Practices (BMPs) to be incorporated into the project design.

A SWQMP is required for development and redevelopment;

- For projects that fall under the eight Permit-specified categories listed in Table 1-1 in the Model WQMP Guidance for San Bernardino County. (Category Projects)
- For projects that have a precise plan of development (e.g. all commercial or industrial projects, residential projects < 10 DU and all other land development projects with potential for significant adverse water quality impacts).

The City may require development of a SWQMP for any projects other than the requirement listed above. It is assumed that each project within the SWIP Specific Plan area will require a separate SWQMP and associated mitigation.

#### **4.3.1 Post-Construction Source Control BMPs**

Examples of source control BMPs for storm water problems include control of air pollutants, enforcement of anti-litter ordinances, educational programs (to limit fertilizer and pesticide use by home gardeners and dumping of waste motor oil in storm drains), street and storm drain maintenance practices, spill prevention and cleanup, and BMPs for erosion control.

#### **4.3.2 Post-Construction Treatment Control**

Examples of treatment control BMPs for storm water include infiltration, wet ponds, extended detention basins, biofilters (such as grassy swales), media filtration (e.g., a settling basin followed by a sand filter), oil/water separators, and constructed wetlands. Because of differences in efficiency among BMPs, combinations of different methods often provide the best treatment.

#### **4.3.3 Construction**

The USEPA's guidance for the issuance of storm water NPDES permits (USEPA 1993) treats construction projects as a subset of industrial discharges. The State Board treats industrial and construction discharges separately, and has issued a statewide construction NPDES permit. The permit applies to construction projects resulting in land disturbance of one acre or greater; the area requirement affects both one-time disturbances and phased projects that cumulatively disturb more than one acre. (A court decision may result in application of the NPDES program to smaller projects, but guidance is not yet available). The permit does not apply to routine or emergency maintenance work sponsored by public agencies, to dredging and/or filling permitted by the U.S. Army Corps of Engineers, or to projects on Indian lands or within the Lake Tahoe Basin. Project proponents are required to:

- Prepare a Storm water Pollution Prevention Plan (SWPPP) before construction begins;
- File a Notice of Intent (NOI) with the State Board before construction begins; and
- File a Notice of Termination with the State Board once construction is complete.

These requirements are summarized as follows:

Notice of Intent: The NOI certifies that the applicant will comply with conditions in the statewide general NPDES permit. It is not a permit application and does not require approval, although an annual fee must be submitted with it.

Storm water Pollution Prevention Plan: The SWPPP is directed toward construction staff; it describes erosion and runoff control measures to be used during and after construction, and a plan to inspect and maintain these control measures. The SWPPP may be revised during construction in response to changed conditions, or if the properly installed BMPs are ineffective in preventing sediment transport off the site. Revisions to the SWPPP are also required if there are changes in activities which could result in a significant amount of pollutants discharged in storm water.

Notice of Termination: The State Board must be notified (via a Notice of Termination form) once construction is complete. It must also be notified if a change of ownership occurs during construction. In this case, a revised NOI must be submitted, and the SWPPP must be revised by the new owner to reflect any changes in construction conditions.

The general construction permit requires that the project owner arrange for maintenance of drainage/storm water control facilities after project completion; maintenance may be done by private parties or by a public agency such as a community service district. Municipalities may require maintenance agreements. Construction project proponents may request to be placed under individual NPDES permits rather than the general permit. The Regional Board may issue individual storm water NPDES permits to construction projects when more stringent controls are necessary to protect water quality. As noted above, individual construction projects may also be regulated under a municipality's NPDES management program.

## 5.0 STORM DRAIN COST ESTIMATE

As discussed in **Section 4**, the proposed project would increase in imperviousness which leads to increase in runoff within the project area. Existing drainage is primarily in the street and existing storm drains along Beech and Hemlock Ave. One possible alternative to address the impacts of the proposed project is to implement the proposed planned facilities as identified in the Master Plan of Drainage. Detailed hydrology & hydraulics and storm drain design has not been conducted for the SWIP area; however since the land use used in the MPD is similar to the SWIP, implementation of the MPD is recommended. The system described here represents one possible solution.

Construction cost estimates for the proposed storm drain facilities were generated by Hall and Foreman Inc., in the Master Storm Drainage Plan Study (1992). The costs presented in this study are based upon 2009 dollars. The costs include drainage improvements (Storm drains, junction structures and catch basins etc.) and 15% contingency. **Table 5.1** shows the updated cost for each system. Figure 7 shows the proposed MPD facilities.

| <b>Table 5.1 – Construction Cost</b> |                    |                    |                            |
|--------------------------------------|--------------------|--------------------|----------------------------|

## EXECUTIVE SUMMARY

This study analyzes the forecast traffic conditions associated with the proposed Southwest Industrial Park (SWIP) Specific Plan project located in City of Fontana. The proposed Specific Plan identifies 10 Districts where land use planning is refined to help guide future development in a cohesive manner. For the purposed of the traffic analysis, trip generation is identified for 15 zones, generally coinciding with the Districts. The proposed project site is generally defined as the area between the Interstate 10 (I-10) freeway and Jurupa Avenue and the area between Etiwanda Avenue and Sierra Avenue. Regional access is provided via interchanges with I-10, Interstate 15 (I-15), and State Route 60 (SR-60).

When accounting for displaced land uses, the proposed project is forecast to generate approximately 219,929 net new daily trips, which include approximately 21,091 a.m. net new peak hour trips and approximately 22,880 p.m. net new peak hour trips.

Since the collection of baseline traffic data for this analysis, improvements have been implemented at the following locations:

- Cypress Avenue overcrossing providing vehicular connectivity between Slover Avenue and Valley Boulevard over I-10;
- Sierra Avenue/Jurupa Street intersection improvements; and
- Jurupa Avenue widening to a 6-lane roadway between Sierra Avenue to Poplar Avenue with traffic signals at Sierra Avenue, Cypress Avenue, Citrus Avenue, and Poplar Avenue.

Both the Cherry Avenue/I-10 and the Citrus Avenue/I-10 interchanges are in construction phase as of September 2011, with completion of construction anticipated in the year 2013.

Improvements are identified at the following roadway segments to achieve acceptable operations at the deficient roadway segments for forecast existing with project conditions:

- Mulberry Avenue;
- Beech Avenue;
- Jurupa Street between Etiwanda Avenue and Mulberry Avenue;
- Mulberry Avenue between Slover Avenue and Jurupa Street;
- Jurupa Street between Mulberry Avenue and Cherry Avenue;
- Beech Avenue between Slover Avenue and Jurupa Avenue;
- Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue; and
- Citrus Avenue between Santa Ana Avenue and Jurupa Street.

Improvements are identified at the following study intersections to achieve acceptable operations at the deficient intersections for forecast existing with project conditions:

- Etiwanda Avenue/San Bernardino Avenue;
- Etiwanda Avenue/East Airport Drive-Slover Avenue;
- Etiwanda Avenue/Jurupa Street;

- Mulberry Avenue/Slover Avenue;
- Mulberry Avenue/Santa Ana Avenue;
- Mulberry Avenue/Jurupa Street;
- Banana Avenue/Valley Boulevard;
- Cherry Avenue/Valley Boulevard;
- Cherry Avenue/Slover Avenue;
- Cherry Avenue/Jurupa Street;
- Beech Avenue/Valley Boulevard;
- Beech Avenue/Slover Avenue;
- Beech Avenue/Santa Ana Avenue;
- Beech Avenue/Jurupa Street;
- Citrus Avenue/Valley Boulevard;
- Citrus Avenue/Slover Avenue;
- Citrus Avenue/Santa Ana Avenue;
- Citrus Avenue/Jurupa Street;
- Sierra Avenue/Slover Avenue;
- Sierra Avenue/Jurupa Street; and
- Armstrong Road/SR-60 Eastbound Ramps.

Roadway segment improvements are identified at the following roadway segments to achieve acceptable operations at the deficient roadway segments for forecast year 2030 with project conditions:

- Mulberry Avenue;
- Beech Avenue;
- Cypress Avenue;
- Jurupa Street between Etiwanda Avenue and Mulberry Avenue;
- Mulberry Avenue between Slover Avenue and Jurupa Street;
- Country Village Road between Philadelphia Avenue and SR-60 Westbound Ramps;
- Jurupa Street between Mulberry Avenue and Cherry Avenue;
- San Bernardino Avenue between Cherry Avenue and Fontana Avenue;
- Jurupa Street between Cherry Avenue and Citrus Avenue;
- Beech Avenue between Slover Avenue and Jurupa Street;
- Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue;
- Citrus Avenue between Santa Ana Avenue and Jurupa Street; and

- Jurupa Street between Citrus Avenue and Sierra Avenue.

Improvements are identified at the following study intersections to achieve acceptable operations at the deficient intersections for forecast year 2030 with project conditions:

- I-15 Southbound Ramps/Jurupa Street;
- Etiwanda Avenue/San Bernardino Avenue;
- Etiwanda Avenue/East Airport Drive-Slover Avenue;
- Etiwanda Avenue/Jurupa Street;
- Commerce Way/Ontario Mills Parkway;
- Mulberry Avenue/Slover Avenue;
- Mulberry Avenue/Santa Ana Avenue;
- Mulberry Avenue/Jurupa Street;
- Banana Avenue/Valley Boulevard;
- Cherry Avenue/San Bernardino Avenue;
- Cherry Avenue/Valley Boulevard;
- Cherry Avenue/Slover Avenue;
- Cherry Avenue/Santa Ana Avenue;
- Cherry Avenue/Jurupa Street;
- Beech Avenue/Valley Boulevard;
- Beech Avenue/Slover Avenue;
- Beech Avenue/Santa Ana Avenue;
- Beech Avenue/Jurupa Street;
- Citrus Avenue/Valley Boulevard;
- Citrus Avenue/Slover Avenue;
- Citrus Avenue/Santa Ana Avenue;
- Citrus Avenue/Jurupa Street;
- Sierra Avenue/Slover Avenue;
- Sierra Avenue/Jurupa Street; and
- Armstrong Road/SR-60 Eastbound Ramps.

## **INTRODUCTION**

This study analyzes the forecast traffic conditions associated with the proposed Southwest Industrial Park (SWIP) Specific Plan project located in City of Fontana. The proposed Specific Plan identifies 10 Districts where land use planning is refined to help guide future development in a cohesive manner. For the purposes of the traffic analysis, trip generation is identified for 15 sub-zones, generally coinciding with the Districts. Roadway and intersection analysis has been prepared to identify improvements to support buildout of the Specific Plan and guide planning efforts to facilitate infrastructure improvements.

The proposed project site is generally defined as the area between the Interstate 10 (I-10) freeway and Jurupa Avenue and the area between Etiwanda Avenue and Sierra Avenue. Regional access is provided via interchanges with I-10, Interstate 15 (I-15), and State Route 60 (SR-60). Exhibit 1 shows the regional location of the project site. Exhibit 2 shows the project site location.

### **Study Area**

The study evaluates the following forty-five (45) intersections in the vicinity of the project site:

1. I-15 Southbound Ramps/Jurupa Street;
2. I-15 Northbound Ramps/Jurupa Street;
3. Etiwanda Avenue/San Bernardino Avenue;
4. Etiwanda Avenue/I-10 Westbound Ramps;
5. Etiwanda Avenue/I-10 Eastbound Ramps;
6. Etiwanda Avenue/East Airport Drive-Slover Avenue;
7. Etiwanda Avenue/Jurupa Street;
8. Etiwanda Avenue/Marlay Avenue;
9. Etiwanda Avenue/Philadelphia Avenue;
10. Etiwanda Avenue/SR-60 Westbound Off-Ramp;
11. Etiwanda Avenue/SR-60 Eastbound On-Ramp;
12. Commerce Drive-I-10 Westbound Ramps/Valley Boulevard;
13. Mulberry Avenue/Slover Avenue;
14. Mulberry Avenue/Santa Ana Avenue;
15. Mulberry Avenue/Jurupa Street;
16. Mulberry Avenue/Marlay Avenue;
17. Mulberry Avenue-Country Village Road/Philadelphia Avenue;
18. Country Village Road/SR-60 Westbound Ramps;
19. Country Village Road/SR-60 Eastbound Ramps;
20. Banana Avenue/San Bernardino Avenue;

44. Armstrong Road/SR-60 Westbound Ramps; and
45. Armstrong Road/SR-60 Eastbound Ramps.

The Cherry Avenue/I-10 and the Citrus Avenue/I-10 interchanges have recently been analyzed extensively to address the needs of the interchange improvements through standard Caltrans procedures. Design plans have been prepared based on the following Project Reports:

- I-10/Cherry Avenue Interchange Improvements Project Report (February 2009); and
- I-10/Citrus Avenue Interchange Improvements Project Report (August 2008).

Both the Cherry Avenue/I-10 and the Citrus Avenue/I-10 interchanges are in construction phase as of September 2011, with completion of construction anticipated in the year 2013. Since these interchanges were recently analyzed, and design plans are being implemented to accommodate long-range traffic volumes, this report does not duplicate analysis efforts.

Additionally, this study evaluates operations at the following roadway segments:

- Fourth Street-San Bernardino Avenue between I-15 and Fontana Avenue;
- Valley Boulevard between Etiwanda Avenue and Sierra Avenue;
- East Airport Drive between I-15 and Etiwanda Avenue;
- Slover Drive between Etiwanda Avenue and Sierra Avenue;
- Jurupa Street between I-15 and Sierra Avenue;
- Philadelphia Avenue between I-15 and Mulberry Avenue-Country Village Road;
- Etiwanda Avenue between San Bernardino Avenue and SR-60;
- Mulberry Avenue between Slover Avenue and Philadelphia Avenue;
- Country Village Road between Philadelphia Avenue and SR-60;
- Cherry Avenue between San Bernardino Avenue and Jurupa Street;
- Beech Avenue between Slover Avenue and Santa Ana Avenue;
- Citrus Avenue between San Bernardino Avenue and Jurupa Street;
- Sierra Avenue between Slover Avenue and Armstrong Road; and
- Armstrong Road between Sierra Avenue and SR-60.

The study roadways and intersections are primarily located within the City of Fontana, however, some of the study facilities are shared jurisdiction, or fully within jurisdiction of the following agencies:

- Caltrans;
- City of Ontario;
- City of Jurupa Valley;
- County of San Bernardino; and
- County of Riverside.

Exhibits 3 and 4 show the locations of the study intersections and roadway segments, which are analyzed for the following study scenarios:

- Existing Conditions;
- Forecast Existing With Project Conditions;
- Forecast Year 2030 Without Project Conditions; and
- Forecast Year 2030 With Project Conditions.

### **Roadway Segment Analysis Methodology**

Level of service (LOS) is commonly used as a qualitative description of roadway segment operation and is based on the capacity of the roadway segment and the volume of traffic using the roadway segment. The City of Fontana utilizes the Volume-to-Capacity (V/C) analysis methodology to determine the operating LOS of the roadway segments.

## Study Intersection Locations

Exhibit 4

This Page Intentionally Left Blank

The V/C analysis methodology describes the operation of a roadway segment using a range of LOS from LOS A (free-flow conditions) to LOS F (severely congested conditions), based on the corresponding Volume/Capacity (V/C) ratios shown in Table 1.

**Table 1**  
**V/C & LOS Ranges**

| Roadway Segment    |     |
|--------------------|-----|
| V/C Ratio          | LOS |
| $\leq 0.60$        | A   |
| $> 0.61 \leq 0.70$ | B   |
| $> 0.71 \leq 0.80$ | C   |
| $> 0.81 \leq 0.90$ | D   |
| $> 0.91 \leq 1.00$ | E   |
| $> 1.00$           | F   |

<sup>1</sup> = Modified Primary with 5 lanes assumes LOS E capacity equal to 41,000.

### Intersection Analysis Methodology

The City of Fontana utilizes the *Highway Capacity Manual (HCM)* intersection analysis methodology to analyze the operation of unsignalized intersections. The *HCM* analysis methodology describes the operation of an intersection using a range of LOS from LOS A (free-flow conditions) to LOS F (severely congested conditions), based on the corresponding stopped delay experienced per vehicle for unsignalized intersections shown in Table 4.

**Table 4**  
**LOS & Delay Ranges**

| LOS | Delay (seconds/vehicle)  |                            |
|-----|--------------------------|----------------------------|
|     | Signalized Intersections | Unsignalized Intersections |
| A   | $\leq 10.0$              | $< 10.0$                   |
| B   | $> 10.0 \leq 20.0$       | $> 10.0$ to $< 15.0$       |
| C   | $> 20.0 \leq 35.0$       | $> 15.0$ to $< 25.0$       |
| D   | $> 35.0 \leq 55.0$       | $> 25.0$ to $< 35.0$       |
| E   | $> 55.0 \leq 80.0$       | $> 35.0$ to $< 50.0$       |
| F   | $> 80.0$                 | $> 50.0$                   |

**Source:** 2000 *Highway Capacity Manual*.

Level of service is based on the average stopped delay per vehicle for all movements of signalized intersections and all-way stop-controlled intersections; for one-way or two-way stop-controlled intersections, LOS is based on the worst stop-controlled approach.

### Performance Criteria

The *Caltrans Guide for the Preparation of Traffic Impact Studies (Caltrans, December 2002)* provides a target LOS of the “transition between LOS C and LOS D.”

The San Bernardino Associated Governments *Congestion Management Program for San Bernardino County (SANBAG, December 2007)* indicates “In no case shall the LOS standards established be below the level of service E, or the current level, whichever is farthest from level of service A.” Therefore, the SANBAG target for traffic operations is LOS E or better.

The Ontario Plan Mobility Element provides Goal M1 to provide “A system of roadways that meets the mobility needs of a dynamic and prosperous Ontario,” with a target operation of LOS E for all intersections.

The City of Fontana Circulation Element provides goals and policies to develop a balanced transportation system that meets the mobility needs of current and future residents with safe and efficient movement of vehicles, people and goods. Goal #1, Policy #12 indicates the following:

*All streets and intersections design after the adoption of the General Plan will be planned to function at level of service (LOS) C or better, wherever possible. Improvements to existing streets will be designed to LOS C standards whenever feasible.*

Since the entirety of the project study area consists of roadways planned, constructed, and managed since the adoption of the current General Plan, achieving the LOS C target is considered a notable burden and is beyond feasibility. Typically ensuring LOS C within the built environment as suggested requires roadway widening that is detrimental to commercial activities, property rights, and includes substantial costs to implement. The City of Fontana Circulation Element also includes the statement that “Level of Service D is typically considered the worst acceptable level in an urbanized area”.

Due to the overriding benefits/consideration of building within this developed area, Transportation Demand Management strategies and policies will also be implemented as a cost effective alternative to increasing capacity and will deliver better environmental outcomes, improved public health, stronger communities and livable cities. The City of Fontana has a fully functional, staffed Traffic Management Center to achieve these goals.

Based on discussions with City staff, and consistent with the City of Fontana Circulation Element and the *Fontana Business Center Traffic Impact Analysis (Meyer, Mohaddes Associates, Inc., April 2003)*, this study utilizes an LOS target of LOS D or better for roadway segment and intersection operation.

### **Consistency With General Plan Circulation Element**

This traffic analysis conservatively does not assume implementation roadway improvements identified in the Circulation Element such as widening and extension of Mulberry Avenue northerly over Interstate 10 to Valley Boulevard. Instead, the analysis has been prepared to determine which items of the Circulation Element need to be implemented to provide acceptable roadway and intersection operations. Where improvements are identified beyond that assumed in the Circulation Element, the recommendation provides indication the measure is in excess of roadway improvements previously envisioned in the study area. Exhibit 5 shows the Circulation Element as included in the City of Fontana General Plan (Adopted 2003). Exhibit 6 shows the Designated Truck Routes included in the City of Fontana General Plan (Adopted 2003).

## City of Fontana Truck Routes

Exhibit 6

In accordance with City staff direction, the existing intersection movement counts were recorded by vehicle axle classification, to which the following San Bernardino Associated Governments (SANBAG) provided passenger car equivalent (PCE) factors were applied:

- Bus = 1.5 PCE;
- 2-axle = 1.5 PCE;
- 3-axle = 2 PCE; and
- 4-axle or more = 3 PCE.

### **Existing Conditions Peak Hour Traffic Volumes**

To determine the existing operation of the study roadways and intersections, average daily traffic (ADT) volumes for the roadway circulation system and intersection movement counts were collected in February 2009. Additionally, traffic counts were obtained from City of Fontana staff for ten of the 45 study intersections and grown one percent per year to reflect year 2009 conditions. Detailed traffic count data is contained in Appendix A.

Exhibit 7 shows existing ADT volumes for the study roadways. Exhibits 8 through 10 show existing PCE-adjusted a.m. peak hour and p.m. peak hour volumes at the study intersections. Exhibits 11 through 13 show existing conditions study intersection geometry. Exhibit 14 shows existing conditions roadway segment geometry.

### **Existing Conditions Roadway Segment LOS**

Table 5 summarizes existing roadway segment ADT volumes and corresponding LOS.

**Note:** NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound; delay shown in seconds per vehicle; deficient intersection operation shown in **bold**. N/A = Not applicable, since analysis of these intersections is addressed by recent Project Reports.

As shown in Table 6, the following four study intersections are currently operating at a deficient LOS (LOS E or worse) according to agency performance criteria:

- Etiwanda Avenue/East Airport Drive-Slover Avenue (p.m. peak hour only);
- Banana Avenue/Valley Boulevard (p.m. peak hour only);
- Beech Avenue/Jurupa Street (p.m. peak hour only); and
- Armstrong Road/SR-60 Eastbound Ramps (both a.m. and p.m. peak hours).

## PROPOSED PROJECT

The proposed Southwest Industrial Park (SWIP) Specific Plan project located in City of Fontana. The proposed Specific Plan identifies 10 Districts where land use planning is refined to help guide future development in a cohesive manner. For the purposes of the traffic analysis, trip generation is identified for 15 sub-zones, generally coinciding with the Districts. The proposed project site is generally defined as the area between the Interstate 10 (I-10) freeway and Jurupa Avenue and the area between Etiwanda Avenue and Sierra Avenue.

Exhibit 15 shows the locations of the 10 proposed project districts. Refer to Appendix C and the Specific Plan for details regarding proposed and displaced land uses for the project.

## Trip Generation of Proposed Project

To calculate trips forecast to be generated by the proposed project, *Institute of Transportation Engineers (ITE)* trip generation rates were used.

Table 7 summarizes *ITE* trip generation rates used to calculate the number of trips forecast to be generated by the existing and proposed project land uses.

**Table 7**  
**ITE Trip Rates for Existing & Proposed Project Land Uses**

| Land Use (ITE Code)          | Units | AM Peak Hour Rates |      |       | PM Peak Hour Rates |      |       | Daily Trip Rate |

| Slover West Industrial                        | 1,934              | 322          | 2,256         | 400                | 1,980         | 2,380         | 21,344         |
| Speedway Industrial                           | 861                | 126          | 987           | 145                | 901           | 1,046         | 8,358          |
| SWIP Residential Trucking (1, 3, and 4)       | 15                 | 47           | 62            | 54                 | 31            | 85            | 803            |
| <b>Forecast Total Net Trip Generation</b>     | <b>17,878</b>      | <b>3,213</b> | <b>21,091</b> | <b>5,009</b>       | <b>17,872</b> | <b>22,880</b> | <b>219,929</b> |

**Note:** SWIP = Southwest Industrial Plan.

As shown in Table 8, when accounting for displaced land uses, the proposed project is forecast to generate approximately 219,929 net new daily trips, which include approximately 21,091 a.m. net new peak hour trips and approximately 22,880 p.m. net new peak hour trips.

This trip generation is conservative since it does not utilize the High-Cube Warehouse trip rate which has been developed in recent years to account for warehousing/distribution facilities that have high lot coverage, minimal staffing, and associated low trip generation. As the proposed project develops the inclusion of distribution centers matching the High-Cube Warehouse trip rate will produce lower trip generation than included in this report.

### **Trip Distribution of Proposed Project**

Forecast distribution of trips forecast to be generated by the proposed project is based on field reconnaissance, understanding of the circulation system, and City-provided information. Exhibit 16 shows the forecast trip percent distribution of the proposed project for each district.

### **Trip Assignment of Proposed Project**

Exhibit 17 shows the corresponding forecast assignment of project-generated roadway segment ADT assuming the trip percent distribution shown in Exhibit 16. Exhibits 18 through 20 show the corresponding forecast a.m. peak hour and p.m. peak hour assignment of project-generated trips at the study intersections.

## **FORECAST EXISTING WITH PROJECT CONDITIONS**

### **Forecast Existing With Project Conditions Traffic Volumes**

Forecast existing with project conditions traffic volumes are derived by adding trips forecast to be generated by the proposed project to existing conditions traffic volumes.

Exhibit 21 shows forecast existing with project conditions roadway segment ADT volumes. Exhibits 22 through 24 show forecast existing with project conditions PCE-adjusted a.m. peak hour and p.m. peak hour volumes at the study intersections.

### **Forecast Existing With Project Conditions Roadway Segment LOS**

Table 9 summarizes forecast existing with project conditions roadway segment ADT volumes and corresponding LOS.

**Note:** EB = eastbound; WB = westbound; btwn = between; Ex+P = Existing Plus Project.

As shown in Table 9, with the addition of project-generated trips, the following nine roadway segments are forecast to operate at a deficient LOS according to agency performance criteria for forecast existing with project conditions:

- Jurupa Street between Etiwanda Avenue and Mulberry Avenue;
- Mulberry Avenue between Slover Avenue and Jurupa Street;
- Jurupa Street between Mulberry Avenue and Cherry Avenue;
- Cherry Avenue between San Bernardino Avenue and I-10 Westbound Ramps;
- Cherry Avenue between I-10 Eastbound Ramps and Jurupa Street;
- Jurupa Street between Cherry Avenue and Citrus Avenue;
- Citrus Avenue between San Bernardino Avenue and I-10 Westbound Ramps;
- Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue; and
- Citrus Avenue between Santa Ana Avenue and Jurupa Street.

It is worth noting, high forecast traffic volumes on Cherry Avenue and Citrus Avenue in the vicinity of Interstate 10 are related to the lack of parallel north-south roadways such as Mulberry Avenue and Beech Avenue, which are identified as future crossings of I-10 in the City of Fontana Circulation Master Plan. Since the collection of baseline traffic data for this analysis, the Cypress Avenue overcrossing has been constructed provides vehicular connectivity between Slover Avenue and Valley Boulevard over I-10.

#### **Forecast Existing With Project Conditions Study Intersection LOS**

Table 10 summarizes forecast existing with project conditions a.m. peak hour and p.m. peak hour LOS of the study intersections, detailed LOS analysis sheets are contained in Appendix B.

**Note:** NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound; delay shown in seconds per vehicle; deficient intersection operation shown in **bold**. N/A = Not applicable, since analysis of these intersections is addressed by recent Project Reports.

As shown in Table 10, with the addition of project-generated trips, the following 19 study intersections are forecast to operate at a deficient LOS (LOS E or worse) according to agency performance criteria for forecast existing with project conditions:

- Etiwanda Avenue/East Airport Drive-Slover Avenue (both a.m. and p.m. peak hours);
- Etiwanda Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Mulberry Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Banana Avenue/Valley Boulevard (p.m. peak hour only);
- Cherry Avenue/San Bernardino Avenue (both a.m. and p.m. peak hours);
- Cherry Avenue/Valley Boulevard (both a.m. and p.m. peak hours);
- Cherry Avenue/Slover Avenue (both a.m. and p.m. peak hours);
- Cherry Avenue/Santa Ana Avenue (both a.m. and p.m. peak hours);
- Cherry Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Beech Avenue/Valley Boulevard (both a.m. and p.m. peak hours);
- Beech Avenue/Slover Avenue (both a.m. and p.m. peak hours);

- Beech Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Citrus Avenue/Valley Boulevard (both a.m. and p.m. peak hours);
- Citrus Avenue/Slover Avenue (both a.m. and p.m. peak hours);
- Citrus Avenue/Santa Ana Avenue (both a.m. and p.m. peak hours);
- Citrus Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Sierra Avenue/Slover Avenue (p.m. peak hour only);
- Sierra Avenue/Jurupa Street (both a.m. and p.m. peak hours); and
- Armstrong Road/SR-60 Eastbound Ramps (both a.m. and p.m. peak hours).

Since the collection of baseline traffic data for this analysis, the Sierra Avenue/Jurupa Street intersection has been improved to accommodate forecast existing with project conditions traffic volumes.

### **Forecast Existing With Project Conditions Recommended Improvements**

Improvements have been identified to provide acceptable operations at the study segments and study intersections. Some improvements may already be included in funding programs, such as the City of Fontana 7-Year Capital Improvement Program (CIP). The 7-Year CIP serves as a planning tool which coordinates financing and scheduling of major infrastructure projects within the City. Projects not already included in a fee program with financing and scheduling identified will require project and funding approvals to incorporate in City planning the improvement implementation.

The following improvements are identified to achieve acceptable operations at the deficient roadway segments for forecast existing with project conditions:

- |                          |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Improvement No. 1</b> | <b>Mulberry Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Mulberry Avenue connection from Slover Avenue to Valley Boulevard over I-10 freeway. This improvement is identified to provide additional north-south capacity, reducing forecast traffic on Etiwanda Avenue and Cherry Avenue.                                                                                               |
| <b>Improvement No. 2</b> | <b>Beech Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Beech Avenue from Slover Avenue to Valley Boulevard including an interchange with I-10. This improvement is consistent with City of Fontana Circulation Master Plan. This improvement is identified to provide additional north-south capacity and freeway access, reducing forecast traffic on Cherry Avenue and Citrus Avenue. |
| <b>Improvement No. 3</b> | <b>Jurupa Street between Etiwanda Avenue and Mulberry Avenue</b> – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway segment to a 6-lane divided roadway segment. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded.                                                                                   |

- |                          |                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Improvement No. 4</b> | <b>Mulberry Avenue between Slover Avenue and Jurupa Avenue</b><br>– Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment.                                                                          |
| <b>Improvement No. 5</b> | <b>Jurupa Street between Mulberry Avenue and Cherry Avenue</b> –<br>Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway to a 6-lane divided roadway. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded. |
| <b>Improvement No. 6</b> | <b>Beech Avenue between Slover Avenue and Jurupa Street</b> –<br>Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane divided roadway to a 4-lane divided roadway.                                                                                                 |
| <b>Improvement No. 7</b> | <b>Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue</b> – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment.                                                                     |
| <b>Improvement No. 8</b> | <b>Citrus Avenue between Santa Ana Avenue and Jurupa Street</b><br>– Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment.                                                                         |

The following improvements are identified to achieve acceptable operations at the affected study intersections for forecast existing with project conditions assuming implementation of the identified roadway segment improvements:

- |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Improvement No. 9</b>  | <b>Etiwanda Avenue/San Bernardino Avenue</b> – Widen the northbound Etiwanda Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound San Bernardino Avenue approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Additionally, modify the westbound San Bernardino Avenue signal phasing to include a westbound right-turn overlap, which will preclude U-turn movement from southbound to northbound Etiwanda Avenue. |
| <b>Improvement No. 10</b> | <b>Etiwanda Avenue/East Airport Drive-Slover Avenue</b> – Widen the northbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the southbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one                                                                                   |

through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes.

**Improvement No. 11**

**Etiwanda Avenue/Jurupa Street** – Widen the eastbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 12**

**Mulberry Avenue/Slover Avenue** – In concert with construction of the extension of Mulberry Avenue north of Slover Avenue, widen the northbound Mulberry Avenue approach from one left-turn lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Construct and stripe the southbound Mulberry Avenue approach to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from two through lanes and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one shared through/right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane and two through lanes to consist of one left-turn lane, two through lanes, and one right-turn lane. Additionally, modify the signal phasing to consist of protected left-turn phasing.

**Improvement No. 13**

**Mulberry Avenue/Santa Ana Avenue** – Widen the northbound Mulberry Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Re-stripe the eastbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the westbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Additionally, modify the east-west signal phasing from permitted left-turns to protected left-turns.

**Improvement No. 14**

**Mulberry Avenue/Jurupa Street** – Modify the northbound Mulberry Avenue signal phasing to include a northbound right-turn overlap, which will preclude U-turn movement from westbound to eastbound Jurupa Street. Widen the southbound Mulberry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Additionally, modify the southbound Mulberry Avenue signal phasing to include a southbound right-turn overlap, which will preclude U-turn movement from eastbound to westbound Jurupa Avenue. Widen the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the

westbound Jurupa Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 15**

**Banana Avenue/Valley Boulevard** – Signalize the Banana Avenue/Valley Boulevard intersection. According to the City of Fontana, the Banana Avenue/Valley Boulevard intersection satisfies traffic signal warrants and is in Pre-Construction.

**Improvement No. 16**

**Cherry Avenue/Valley Boulevard** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Valley Boulevard approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane.

**Improvement No. 17**

**Cherry Avenue/Slover Avenue** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, four through lanes and one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, four through lanes, and two right-turn lanes. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and two right-turn lanes.

**Improvement No. 18**

**Cherry Avenue/Jurupa Street** – Widen the northbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the southbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and two right-turn lanes. Widen the eastbound Jurupa Avenue approach from two left-turn lanes, two through lanes, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 19**

**Beech Avenue/Valley Boulevard** – Signalize the Beech Avenue/Valley Boulevard intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through lane

and one right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane.

**Improvement No. 20**

**Beech Avenue/Slover Avenue** – Signalize the Beech Avenue/Slover Avenue intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.

**Improvement No. 21**

**Beech Avenue/Santa Ana Avenue** – Signalize the Beech Avenue/Santa Ana Avenue intersection.

**Improvement No. 22**

**Beech Avenue/Jurupa Street** – Signalize the Beech Avenue/Jurupa Street intersection. Widen the eastbound Jurupa Street approach from one shared left-turn/through lane and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane.

**Improvement No. 23**

**Citrus Avenue/Valley Boulevard** – Widen the northbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Valley Boulevard approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes.

**Improvement No. 24**

**Citrus Avenue/Slover Avenue** – Widen the northbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through

lanes, and two right-turn lanes. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.

**Improvement No. 25**

**Citrus Avenue/Santa Ana Avenue** – Signalize the Citrus Avenue/Santa Ana Avenue intersection. Widen the northbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the southbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the eastbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Re-stripe the westbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane.

**Improvement No. 26**

**Citrus Avenue/Jurupa Street** – Signalize the Citrus Avenue/Jurupa Street intersection. Widen the southbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Widen the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.

**Improvement No. 27**

**Sierra Avenue/Slover Avenue** – Widen the eastbound Slover Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 28**

**Sierra Avenue/Jurupa Street** – Widen the southbound Sierra Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lane, two through lanes, and two right-turn lanes. Widen the eastbound Jurupa Street approach from one left-turn lane, one shared left-turn/through lane, one through lane, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.

Improvements have recently been constructed at this intersection satisfying the lane configuration recommended.

**Improvement No. 29**      **Armstrong Road/SR-60 Eastbound Ramps** – Contribute towards preparation of a Project Study Report to improve operations, circulation, and access at the Armstrong Road/SR-60 interchange.

Exhibit 25 shows the improved forecast existing with project conditions roadway segment geometry and circulation system. Exhibits 26 through 28 shows improved forecast existing with project conditions study intersection geometry.

#### **Improved Forecast Existing With Project Conditions Roadway Segment LOS**

Table 11 summarizes improved forecast existing with project conditions roadway segment ADT volumes and corresponding LOS assuming implementation of the recommended roadway segment improvements.

## Area 1 - Improved Forecast Existing With Project Conditions Study Intersection Geometry

## Area 2 - Improved Forecast Existing With Project Conditions Study Intersection Geometry

## Area 3 - Improved Forecast Existing With Project Conditions Study Intersection Geometry

**Table 11**  
**Improved Forecast Existing With Project Conditions Roadway Segment ADT & LOS**

| Study Roadway Segment                                           | LOS E Capacity | Forecast Ex+P ADT Volumes | Volume to Capacity Ratio | LOS |

**Note:** EB = eastbound; WB = westbound; btwn = between; Ex+P = Existing Plus Project.

As shown in Table 11, assuming implementation of the identified roadway segment improvements, the study roadway segments are forecast to operate at an acceptable LOS according to agency performance criteria.

## Improved Forecast Existing With Project Conditions Study Intersection LOS

Table 12 summarizes improved forecast existing with project conditions a.m. peak hour and p.m. peak hour LOS of the improved study intersections assuming implementation of the identified roadway segment improvements (Improvements 1 through 11); detailed LOS analysis sheets are contained in Appendix B.

**Table 12**  
**Improved Forecast Existing With Project**  
**Conditions AM & PM Peak Hour Intersection LOS**

| Study Intersection                          | Forecast Existing Without Project Conditions |                      | Improved Forecast Existing With Project Conditions |              |
|---------------------------------------------|----------------------------------------------|----------------------|----------------------------------------------------|--------------|
|                                             | AM Peak Hour                                 | PM Peak Hour         | AM Peak Hour                                       | PM Peak Hour |
|                                             | Delay – LOS                                  | Delay – LOS          | Delay – LOS                                        | Delay – LOS  |

**Note:** NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound; delay shown in seconds per vehicle; deficient intersection operation shown in **bold**; TBD = To be determined pending outcome of Project Study Report.

As shown in Table 12, assuming implementation of the identified intersection improvements, the study intersections are forecast to operate at an acceptable LOS according to agency performance criteria for improved forecast existing with project conditions.

## **FORECAST YEAR 2030 WITHOUT PROJECT CONDITIONS**

It should be noted, forecast year 2030 conditions does not assume implementation of the recommended improvements identified for forecast existing with project conditions.

As directed by City staff, forecast year 2030 conditions assumes the following intersection geometry at the currently under-construction Sierra Avenue/Jurupa Street intersection:

- Northbound Sierra Avenue approach is planned to consist of two left-turn lanes, two through lanes, and one right-turn lane;
- Southbound Sierra Avenue approach is planned to consist of two left-turn lanes, two through lanes, and one right-turn lane;
- Eastbound Jurupa Street approach is planned to consist of two left-turn lanes, two through lanes, and one right-turn lane; and
- Westbound Jurupa Street approach is planned to consist of two left-turn lanes, two through lanes, and one right-turn lane.

### **Forecast Year 2030 Without Project Conditions Peak Hour Traffic Volumes**

Forecast year 2030 conditions traffic volumes are derived by increasing existing traffic volumes one percent per year as directed by City staff.

Exhibit 29 shows forecast year 2030 without project conditions ADT volumes for the study roadways. Exhibits 30 through 32 shows forecast year 2030 without project conditions PCE-adjusted a.m. peak hour and p.m. peak hour volumes at the study intersections.

### **Forecast Year 2030 Without Project Conditions Roadway Segment LOS**

Table 13 summarizes forecast year 2030 without project conditions roadway segment ADT volumes and corresponding LOS.

**Note:** NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound; delay shown in seconds per vehicle; deficient intersection operation shown in **bold**. N/A = Not applicable, since analysis of these intersections is addressed by recent Project Reports.

As shown in Table 14, the following 12 study intersections are forecast to operate at a deficient LOS (LOS E or worse) according to agency performance criteria for forecast year 2030 without project conditions:

- Etiwanda Avenue/East Airport Drive-Slover Avenue (p.m. peak hour only);
- Mulberry Avenue/Jurupa Street (p.m. peak hour only);
- Banana Avenue/Valley Boulevard (p.m. peak hour only);
- Cherry Avenue/I-10 Westbound Ramps (a.m. peak hour only);
- Cherry Avenue/I-10 Eastbound Ramps (p.m. peak hour only);
- Beech Avenue/Valley Boulevard (p.m. peak hour only);
- Beech Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Citrus Avenue/Valley Boulevard (both a.m. and p.m. peak hours);
- Citrus Avenue/I-10 Westbound Ramps (p.m. peak hour only);
- Citrus Avenue/I-10 Eastbound Ramps (p.m. peak hour only);
- Citrus Avenue/Jurupa Street (p.m. peak hour only); and
- Armstrong Road/SR-60 Eastbound Ramps (both a.m. and p.m. peak hours).

## **FORECAST YEAR 2030 WITH PROJECT CONDITIONS**

### **Forecast Year 2030 With Project Conditions Traffic Volumes**

Forecast year 2030 with project conditions traffic volumes are derived by adding trips forecast to be generated by the proposed project to forecast year 2030 without project conditions traffic volumes.

Exhibit 33 shows forecast year 2030 with project conditions roadway segment ADT volumes. Exhibits 34 through 36 show forecast year 2030 with project conditions PCE-adjusted a.m. peak hour and p.m. peak hour volumes at the study intersection.

### **Forecast Year 2030 With Project Conditions Roadway Segment LOS**

Table 15 summarizes forecast year 2030 with project conditions roadway segment ADT volumes and corresponding LOS.

Not to Scale

| Valley Blvd btwn Citrus Ave and Sierra Ave                      | 36,000         | 14,950                       | 0.415                    | A        |
| Slover Ave btwn Citrus Ave and Sierra Ave                       | 36,000         | 32,272                       | 0.896                    | D        |
| Jurupa St btwn Citrus Ave and Sierra Ave                        | 45,000         | 34,009                       | 0.756                    | C        |
| Sierra Ave btwn Slover Ave and Jurupa St                        | 54,000         | 25,853                       | 0.497                    | A        |
| Sierra Ave btwn Jurupa St and Armstrong Rd                      | 36,000         | 25,820                       | 0.717                    | C        |
| Armstrong Rd btwn Sierra Ave and SR-60 WB Ramps                 | 36,000         | 24,808                       | 0.689                    | B        |

**Note:** EB = eastbound; WB = westbound; btwn = between.

As shown in Table 15, the following ten study roadway segments are forecast to operate at a deficient LOS according to agency performance criteria for forecast year 2030 with project conditions:

- Jurupa Street between Etiwanda Avenue and Mulberry Avenue;
- Mulberry Avenue between Slover Avenue and Jurupa Avenue;
- Country Village Road between Philadelphia Avenue and SR-60 Westbound Ramps;
- Jurupa Street between Mulberry Avenue and Cherry Avenue;
- Cherry Avenue between San Bernardino Avenue and I-10 Eastbound Ramps;
- Cherry Avenue between I-10 Eastbound Ramps and Jurupa Street;
- Jurupa Street between Cherry Avenue and Citrus Avenue;
- Citrus Avenue between San Bernardino Avenue and I-10 Westbound Ramps;
- Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue; and
- Citrus Avenue between Santa Ana Avenue and Jurupa Street.

Note two roadway segments are forecast to operate at LOS E, which are located in the City of Ontario, where LOS E satisfies acceptable operations. It is worth noting, high forecast traffic volumes on Cherry Avenue and Citrus Avenue in the vicinity of Interstate 10 are related to the lack of parallel north-south roadways such as Mulberry Avenue and Beech Avenue, which are identified as future crossings of I-10 in the City of Fontana Circulation Master Plan. Since the collection of baseline traffic data for this analysis, the Cypress Avenue overcrossing has been constructed provides vehicular connectivity between Slover Avenue and Valley Boulevard over I-10.

#### **Forecast Year 2030 With Project Conditions Study Intersection LOS**

Table 16 summarizes forecast year 2030 with project conditions a.m. peak hour and p.m. peak hour study intersection LOS; detailed LOS analysis sheets are contained in Appendix B.

**Note:** NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound; delay shown in seconds per vehicle; deficient intersection operation shown in **bold**. N/A = Not applicable, since analysis of these intersections is addressed by recent Project Reports.

As shown in Table 16, with the addition of project-generated trips, the following 19 study intersections are forecast to continue to operate at a deficient LOS (LOS E or worse) according to agency performance criteria for forecast year 2030 with project conditions:

- Etiwanda Avenue/East Airport Drive-Slover Avenue (both a.m. and p.m. peak hours);
- Etiwanda Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Mulberry Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Banana Avenue/Valley Boulevard (p.m. peak hour only);
- Cherry Avenue/San Bernardino Avenue (both a.m. and p.m. peak hours);
- Cherry Avenue/Valley Boulevard (p.m. peak hour only);
- Cherry Avenue/Slover Avenue (both a.m. and p.m. peak hours);
- Cherry Avenue/Santa Ana Avenue (both a.m. and p.m. peak hours);
- Cherry Avenue/Jurupa Street (p.m. peak hour only);
- Beech Avenue/Valley Boulevard (both a.m. and p.m. peak hours);

- Beech Avenue/Slover Avenue (both a.m. and p.m. peak hours);
- Beech Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Citrus Avenue/Valley Boulevard (both a.m. and p.m. peak hours);
- Citrus Avenue/Slover Avenue (both a.m. and p.m. peak hours);
- Citrus Avenue/Santa Ana Avenue (both a.m. and p.m. peak hours);
- Citrus Avenue/Jurupa Street (both a.m. and p.m. peak hours);
- Sierra Avenue/Slover Avenue (both a.m. and p.m. peak hours);
- Sierra Avenue/Jurupa Street (both a.m. and p.m. peak hours); and
- Armstrong Road/SR-60 Eastbound Ramps (both a.m. and p.m. peak hours).

Since the collection of baseline traffic data for this analysis, the Sierra Avenue/Jurupa Street intersection has been improved to accommodate forecast year 2030 with project conditions traffic volumes.

### **Forecast Year 2030 With Project Conditions Recommended Improvements**

Improvements have been identified to provide acceptable operations at the study segments and study intersections. Some improvements may already be included in funding programs, such as the City of Fontana 7-Year Capital Improvement Program (CIP). The 7-Year CIP serves as a planning tool which coordinates financing and scheduling of major infrastructure projects within the City. Projects not already included in a fee program with financing and scheduling identified will require project and funding approvals to incorporate in City planning the improvement implementation.

The following improvements are identified to achieve acceptable operations at the deficient roadway segments for forecast year 2030 with project conditions:

- |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Improvement No. 30</b> | <b>Mulberry Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Mulberry Avenue connection from Slover Avenue to Valley Boulevard over I-10 freeway. This improvement is identified to provide additional north-south capacity, reducing forecast traffic on Etiwanda Avenue and Cherry Avenue. <i>[Identical to Improvement Number 1.]</i>                                                                                               |
| <b>Improvement No. 31</b> | <b>Beech Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Beech Avenue from Slover Avenue to Valley Boulevard including an interchange with I-10. This improvement is consistent with City of Fontana Circulation Master Plan. This improvement is identified to provide additional north-south capacity and freeway access, reducing forecast traffic on Cherry Avenue and Citrus Avenue. <i>[Identical to Improvement Number 2.]</i> |
| <b>Improvement No. 32</b> | <b>Cypress Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Cypress Avenue from Slover Avenue to Valley Boulevard over I-10 freeway. This improvement is consistent with City of Fontana Circulation Master Plan. This                                                                                                                                                                                                                 |

improvement is identified to provide additional north-south capacity, reducing forecast traffic on Cherry Avenue and Citrus Avenue. This improvement has recently been implemented by the City of Fontana providing the overcrossing connecting Cypress Avenue between Slover Avenue to Valley Boulevard over I-10.

- Improvement No. 33**      **Jurupa Street between Etiwanda Avenue and Mulberry Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway segment to a 6-lane divided roadway segment. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded. *[Identical to Improvement Number 3.]*
- Improvement No. 34**      **Mulberry Avenue between Slover Avenue and Jurupa Street** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment. *[Identical to Improvement Number 4.]*
- Improvement No. 35**      **Country Village Road between Philadelphia Avenue and SR-60 Westbound Ramps** – Consistent with the County of Riverside Circulation Master Plan, widen the study roadway segment from a 4-lane undivided roadway segment to a 6-lane divided roadway segment. Since this improvement is within the jurisdiction of the recently incorporated City of Jurupa Valley, implementation by the City of Fontana cannot be assured. Therefore, this improvement should be included in the planning and collection of fees and coordination with the appropriate lead agency is needed to help administer the improvement.
- Improvement No. 36**      **Jurupa Street between Mulberry Avenue and Cherry Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway to a 6-lane divided roadway. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded. *[Identical to Improvement Number 5.]*
- Improvement No. 37**      **San Bernardino Avenue between Cherry Avenue and Fontana Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane divided roadway to a 4-lane divided roadway. Since this improvement is within the jurisdiction of the County of San Bernardino, implementation by the City of Fontana cannot be assured. Therefore, this improvement should be included in the planning and collection of fees and coordination with the appropriate lead agency is needed to help administer the improvement.
- Improvement No. 38**      **Jurupa Street between Cherry Avenue and Citrus Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 5-lane divided roadway to a 6-lane divided roadway. A portion of this improvement has recently

been implemented by the City of Fontana providing the capacity for a 6-lane roadway between Poplar Avenue and Citrus Avenue.

- Improvement No. 39**      **Beech Avenue between Slover Avenue and Jurupa Street** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane divided roadway to a 4-lane divided roadway. *[Identical to Improvement Number 6.]*
- Improvement No. 40**      **Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment. *[Identical to Improvement Number 7.]*
- Improvement No. 41**      **Citrus Avenue between Santa Ana Avenue and Jurupa Street** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment. *[Identical to Improvement Number 8.]*
- Improvement No. 42**      **Jurupa Street between Citrus Avenue and Sierra Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 5-lane divided roadway to a 6-lane divided roadway. This improvement has recently been implemented by the City of Fontana providing the capacity for a 6-lane roadway between Citrus Avenue and Sierra Avenue.

The following improvements are identified to achieve acceptable operations at the affected study intersections for forecast year 2030 with project conditions assuming implementation of the identified roadway segment improvements:

- Improvement No. 43**      **I-15 Southbound Ramps/Jurupa Street** – Widen the southbound I-15 Southbound Off-Ramp from one left-turn lane, one shared left-turn/through/right-turn lane, and one right-turn lane to consist of two left-turn lanes, one through lane, and one right-turn lane.
- Improvement No. 44**      **Etiwanda Avenue/San Bernardino Avenue** – Widen the northbound Etiwanda Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound San Bernardino Avenue approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes. Additionally, modify the westbound San Bernardino Avenue signal phasing to include a westbound right-turn overlap, which will preclude U-turn movement from southbound to northbound Etiwanda Avenue. *(This recommended improvement is consistent with Improvement No. 9.)*

- Improvement No. 45**      **Etiwanda Avenue/East Airport Drive-Slover Avenue** – Widen the northbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and one shared through/right-turn lane. Widen the southbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the eastbound East Airport Drive approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes. *(This recommended improvement is consistent with Improvement No. 10.)*
- Improvement No. 46**      **Etiwanda Avenue/Jurupa Street** – Widen the eastbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, four through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 11.)*
- Improvement No. 47**      **Commerce Way/Ontario Mills Parkway** – Widen the northbound Commerce Way approach from two left-turn lanes, one through lane, and one right-turn lane.
- Improvement No. 48**      **Mulberry Avenue/Slover Avenue** – In concert with construction of the extension of Mulberry Avenue north of Slover Avenue, widen the northbound Mulberry Avenue approach from one left-turn lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Construct and stripe the southbound Mulberry Avenue approach to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from two through lanes and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane and two through lanes to consist of one left-turn lane, three through lanes, and one right-turn lane. Additionally, modify the signal phasing to consist of protected left-turn phasing. *(This recommended improvement is consistent with Improvement No. 12.)*
- Improvement No. 49**      **Mulberry Avenue/Santa Ana Avenue** – Widen the northbound Mulberry Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Re-stripe the eastbound

Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the westbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Additionally, modify the east-west signal phasing from permitted left-turns to protected left-turns. *(This recommended improvement is identical to Improvement No. 13.)*

**Improvement No. 50**

**Mulberry Avenue/Jurupa Street** – Modify the northbound Mulberry Avenue signal phasing to include a northbound right-turn overlap, which will preclude U-turn movement from westbound to eastbound Jurupa Street. Widen the southbound Mulberry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Additionally, modify the southbound Mulberry Avenue signal phasing to include a southbound right-turn overlap, which will preclude U-turn movement from eastbound to westbound Jurupa Avenue. Widen the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 14.)*

**Improvement No. 51**

**Banana Avenue/Valley Boulevard** – Signalize the Banana Avenue/Valley Boulevard intersection. According to the City of Fontana, the Banana Avenue/Valley Boulevard intersection satisfies traffic signal warrants and is in Pre-Construction. *(This improvement is identical to Improvement No. 15.)*

**Improvement No. 52**

**Cherry Avenue/San Bernardino Avenue** – Widen the eastbound San Bernardino Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane.

**Improvement No. 53**

**Cherry Avenue/Valley Boulevard** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and defacto one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Valley Boulevard approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 16.)*

- Improvement No. 54**      **Cherry Avenue/Slover Avenue** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, five through lanes and one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and two right-turn lanes. Additionally, modify the southbound Cherry Avenue signal phasing to include a southbound right-turn overlap, which will preclude U-turn movement from eastbound to westbound Slover Avenue. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and two right-turn lanes. Additionally, modify the westbound Slover Avenue signal phasing to include a westbound right-turn overlap, which will preclude U-turn movement from southbound to northbound Cherry Avenue. *(This recommended improvement is consistent with Improvement No. 17.)*
- Improvement No. 55**      **Cherry Avenue/Santa Ana Avenue** – Widen the southbound Cherry Avenue approach from one left-turn lane, two through lanes, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.
- Improvement No. 56**      **Cherry Avenue/Jurupa Street** – Widen the northbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the southbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 18.)*
- Improvement No. 57**      **Beech Avenue/Valley Boulevard** – Signalize the Beech Avenue/Valley Boulevard intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 19.)*

- Improvement No. 58**      **Beech Avenue/Slover Avenue** – Signalize the Beech Avenue/Slover Avenue intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 20.)*
- Improvement No. 59**      **Beech Avenue/Santa Ana Avenue** – Signalize the Beech Avenue/Santa Ana Avenue intersection. *(This recommended improvement is identical to Improvement No. 21.)*
- Improvement No. 60**      **Beech Avenue/Jurupa Street** – Signalize the Beech Avenue/Jurupa Street intersection. Widen the northbound Beech Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of two left-turn lanes, one through lane, and one right-turn lane. Widen the eastbound Jurupa Street approach from one shared left-turn/through lane and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 22.)*
- Improvement No. 61**      **Citrus Avenue/Valley Boulevard** – Widen the northbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Valley Boulevard approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes. Additionally, modify the eastbound Valley Boulevard signal phasing to include an eastbound right-turn overlap, which will preclude U-turn movement from northbound to southbound Citrus Avenue. *(This recommended improvement is consistent with Improvement No. 23.)*
- Improvement No. 62**      **Citrus Avenue/Slover Avenue** – Widen the northbound Citrus Avenue approach from one left-turn lane and one shared

through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 24.)*

**Improvement No. 63**

**Citrus Avenue/Santa Ana Avenue** – Signalize the Citrus Avenue/Santa Ana Avenue intersection. Widen the northbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the southbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the eastbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Re-stripe the westbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. *(This recommended improvement is identical to Improvement No. 25.)*

**Improvement No. 64**

**Citrus Avenue/Jurupa Street** – Signalize the Citrus Avenue/Jurupa Street intersection. Widen the northbound Citrus Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one shared through/right-turn lane to consist of one left-turn lane, four through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 26.)*

**Improvement No. 65**

**Sierra Avenue/Slover Avenue** – Widen the eastbound Slover Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, four through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from two left-turn lanes, two through lanes, and two right-turn lanes to consist of two left-turn lanes, three through

lanes, and two right-turn lanes. *(This recommended improvement is consistent with Improvement No. 27.)*

**Improvement No. 66**

**Sierra Avenue/Jurupa Street** – Widen the southbound Sierra Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lane, two through lanes, and two right-turn lanes. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 28.)*

**Improvement No. 67**

**Armstrong Road/SR-60 Eastbound Ramps** – Contribute towards preparation of a Project Study Report to improve operations, circulation, and access at the Armstrong Road/SR-60 interchange. *(This intersection improvement is identical to Improvement No. 29.)*

Exhibit 37 shows the improved forecast year 2030 with project conditions roadway segment geometry and circulation system. Exhibits 38 through 40 show improved forecast year 2030 with project conditions study intersection geometry.

**Improved Forecast Year 2030 With Project Conditions Roadway Segment LOS**

Table 17 summarizes improved forecast year 2030 with project conditions roadway segment ADT volumes and corresponding LOS assuming implementation of the recommended roadway segment improvements.

## Improved Forecast Year 2030 With Project Conditions Roadway Segment Geometry/Circulation System

## Area 1 - Improved Forecast Year 2030 With Project Conditions Study Intersection Geometry

## Area 2 - Improved Forecast Year 2030 With Project Conditions Study Intersection Geometry

**Table 17**  
**Improved Forecast Year 2030 With Project Conditions Roadway Segment ADT & LOS**

| Study Roadway Segment                                           | LOS E Capacity | Forecast 2030 WP ADT Volumes | Volume to Capacity Ratio | LOS |
|-----------------------------------------------------------------|----------------|------------------------------|--------------------------|-----|
| Fourth St btwn I-15 Fwy and Etiwanda Ave                        | 33,000         | 14,746                       | 0.447                    | A   |
| East Airport Drive btwn I-15 Fwy and Etiwanda Ave               | 33,000         | 26,753                       | 0.811                    | D   |
| Jurupa St btwn I-15 Fwy and Etiwanda Ave                        | 49,000         | 48,529                       | 0.990                    | E   |
| Philadelphia Ave btwn I-15 Fwy Etiwanda Ave                     | 12,500         | 4,087                        | 0.327                    | A   |
| Etiwanda Ave btwn San Bernardino Ave and I-10 WB Ramps          | 33,000         | 27,696                       | 0.839                    | D   |

**Note:** EB = eastbound; WB = westbound; btwn = between.

As shown in Table 17, assuming implementation of the identified roadway segment improvements, the study roadway segments are forecast to operate at an acceptable LOS according to agency performance criteria for forecast year 2030 with project conditions. Note two roadway segments are forecast to operate at LOS E, which are located in the City of Ontario, where LOS E satisfies acceptable operations.

#### **Improved Forecast Year 2030 With Project Conditions Study Intersection LOS**

Table 18 summarizes improved forecast year 2030 with project conditions a.m. peak hour and p.m. peak hour LOS of the improved study intersections assuming identified intersection improvements (Improvements 37 through 50); detailed LOS analysis sheets are contained in Appendix B.

**Table 18**

| 45 – Armstrong Rd/SR-60 EB Ramps            | <b>640.2 – F</b>                              | <b>&gt;999.9 – F</b> | TBD                                                 | TBD          |

**Note:** NB = Northbound; SB = Southbound; EB = Eastbound; WB = Westbound; delay shown in seconds per vehicle; deficient intersection operation shown in **bold**; TBD = To be determined pending outcome of Project Study Report.

As shown in Table 18, assuming implementation of the identified intersection improvements, the study intersections are forecast to operate at an acceptable LOS according to agency performance criteria for improved forecast year 2030 with project conditions.

## IMPROVEMENTS IMPLEMENTATION

The purpose of this traffic analysis has been to identify roadway and intersection improvements required to provide acceptable operations assuming implementation of the proposed Specific Plan. It is recommended future development projects within the SWIP shall conduct separate traffic studies. As determined by the subsequent traffic studies, traffic improvements identified in this report shall be implemented as a condition of the approved project, either through direct construction by the project applicant and/or through development impact fees.

Monitoring of traffic generation and phasing of development within the SWIP and adjacent land uses to defer or eliminate improvements due to potential circulation impact changes or reduced land use intensities. This monitoring will be achieved through project specific traffic studies with land use in excess of 100 dwelling units or 100,000 square feet of non-residential land use. Final authority and approval of traffic studies is the City of Fontana.

The following potential funding sources are identified with an understanding that additional sources are likely. Improvements may be funded through a combination of sources such as:

- Developer Mitigation as shown on Individual Traffic Studies;
- City Capital Improvement Projects;
- Developer Impact fees, designated for use on roadways which have been identified in the City Measure I Nexus Study;
- Redevelopment Agency Funding; and
- Transportation Grant Funding.

## IMPROVEMENTS

The following improvements are identified to achieve acceptable operations at the deficient roadway segments for forecast existing with project conditions:

- |                          |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Improvement No. 1</b> | <b>Mulberry Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Mulberry Avenue connection from Slover Avenue to Valley Boulevard over I-10 freeway. This improvement is identified to provide additional north-south capacity, reducing forecast traffic on Etiwanda Avenue and Cherry Avenue.                                                                                               |
| <b>Improvement No. 2</b> | <b>Beech Avenue</b> – Consistent with City of Fontana Circulation Master Plan, construct Beech Avenue from Slover Avenue to Valley Boulevard including an interchange with I-10. This improvement is consistent with City of Fontana Circulation Master Plan. This improvement is identified to provide additional north-south capacity and freeway access, reducing forecast traffic on Cherry Avenue and Citrus Avenue. |
| <b>Improvement No. 3</b> | <b>Jurupa Street between Etiwanda Avenue and Mulberry Avenue</b> – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway segment to a 6-lane divided roadway segment. This                                                                                                                                                                           |

improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded.

- Improvement No. 4**      **Mulberry Avenue between Slover Avenue and Jurupa Avenue**  
– Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment.
- Improvement No. 5**      **Jurupa Street between Mulberry Avenue and Cherry Avenue** –  
Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway to a 6-lane divided roadway. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded.
- Improvement No. 6**      **Beech Avenue between Slover Avenue and Jurupa Street** –  
Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane divided roadway to a 4-lane divided roadway.
- Improvement No. 7**      **Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment.
- Improvement No. 8**      **Citrus Avenue between Santa Ana Avenue and Jurupa Street**  
– Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment.

The following improvements are identified to achieve acceptable operations at the affected study intersections for forecast existing with project conditions assuming implementation of the identified roadway segment improvements:

- Improvement No. 9**      **Etiwanda Avenue/San Bernardino Avenue** – Widen the northbound Etiwanda Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound San Bernardino Avenue approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Additionally, modify the westbound San Bernardino Avenue signal phasing to include a westbound right-turn overlap, which will preclude U-turn movement from southbound to northbound Etiwanda Avenue.
- Improvement No. 10**      **Etiwanda Avenue/East Airport Drive-Slover Avenue** – Widen the northbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the southbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one

shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes.

**Improvement No. 11**

**Etiwanda Avenue/Jurupa Street** – Widen the eastbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 12**

**Mulberry Avenue/Slover Avenue** – In concert with construction of the extension of Mulberry Avenue north of Slover Avenue, widen the northbound Mulberry Avenue approach from one left-turn lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Construct and stripe the southbound Mulberry Avenue approach to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from two through lanes and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one shared through/right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane and two through lanes to consist of one left-turn lane, two through lanes, and one right-turn lane. Additionally, modify the signal phasing to consist of protected left-turn phasing.

**Improvement No. 13**

**Mulberry Avenue/Santa Ana Avenue** – Widen the northbound Mulberry Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Re-stripe the eastbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the westbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Additionally, modify the east-west signal phasing from permitted left-turns to protected left-turns.

**Improvement No. 14**

**Mulberry Avenue/Jurupa Street** – Modify the northbound Mulberry Avenue signal phasing to include a northbound right-turn overlap, which will preclude U-turn movement from westbound to eastbound Jurupa Street. Widen the southbound Mulberry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Additionally, modify the southbound Mulberry Avenue signal phasing to include a southbound right-turn overlap, which will preclude U-turn movement from eastbound to westbound Jurupa Avenue. Widen

the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 15**

**Banana Avenue/Valley Boulevard** – Signalize the Banana Avenue/Valley Boulevard intersection. According to the City of Fontana, the Banana Avenue/Valley Boulevard intersection satisfies traffic signal warrants and is in Pre-Construction.

**Improvement No. 16**

**Cherry Avenue/Valley Boulevard** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Valley Boulevard approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane.

**Improvement No. 17**

**Cherry Avenue/Slover Avenue** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, four through lanes and one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, four through lanes, and two right-turn lanes. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and two right-turn lanes.

**Improvement No. 18**

**Cherry Avenue/Jurupa Street** – Widen the northbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the southbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and two right-turn lanes. Widen the eastbound Jurupa Avenue approach from two left-turn lanes, two through lanes, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

- Improvement No. 19**      **Beech Avenue/Valley Boulevard** – Signalize the Beech Avenue/Valley Boulevard intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane.
- Improvement No. 20**      **Beech Avenue/Slover Avenue** – Signalize the Beech Avenue/Slover Avenue intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.
- Improvement No. 21**      **Beech Avenue/Santa Ana Avenue** – Signalize the Beech Avenue/Santa Ana Avenue intersection.
- Improvement No. 22**      **Beech Avenue/Jurupa Street** – Signalize the Beech Avenue/Jurupa Street intersection. Widen the eastbound Jurupa Street approach from one shared left-turn/through lane and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane.
- Improvement No. 23**      **Citrus Avenue/Valley Boulevard** – Widen the northbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Valley Boulevard approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes.
- Improvement No. 24**      **Citrus Avenue/Slover Avenue** – Widen the northbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of one left-turn lane, two through

lanes, and one right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.

**Improvement No. 25**

**Citrus Avenue/Santa Ana Avenue** – Signalize the Citrus Avenue/Santa Ana Avenue intersection. Widen the northbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the southbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the eastbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Re-stripe the westbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane.

**Improvement No. 26**

**Citrus Avenue/Jurupa Street** – Signalize the Citrus Avenue/Jurupa Street intersection. Widen the southbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Widen the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.

**Improvement No. 27**

**Sierra Avenue/Slover Avenue** – Widen the eastbound Slover Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane.

**Improvement No. 28**

**Sierra Avenue/Jurupa Street** – Widen the southbound Sierra Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lane, two through lanes, and two right-turn lanes. Widen the eastbound Jurupa Street approach from one left-turn lane, one shared left-turn/through lane, one through lane, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one left-

turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Improvements have recently been constructed at this intersection satisfying the lane configuration recommended.

**Improvement No. 29**      **Armstrong Road/SR-60 Eastbound Ramps** – Contribute towards preparation of a Project Study Report to improve operations, circulation, and access at the Armstrong Road/SR-60 interchange.

The following improvements are identified to achieve acceptable operations at the deficient roadway segments for forecast year 2030 with project conditions:

**Improvement No. 30**      **Mulberry Avenue** – Consistent with City of Fontana Circulation Master Plan, construct Mulberry Avenue connection from Slover Avenue to Valley Boulevard over I-10 freeway. This improvement is identified to provide additional north-south capacity, reducing forecast traffic on Etiwanda Avenue and Cherry Avenue. *[Identical to Improvement Number 1.]*

**Improvement No. 31**      **Beech Avenue** – Consistent with City of Fontana Circulation Master Plan, construct Beech Avenue from Slover Avenue to Valley Boulevard including an interchange with I-10. This improvement is consistent with City of Fontana Circulation Master Plan. This improvement is identified to provide additional north-south capacity and freeway access, reducing forecast traffic on Cherry Avenue and Citrus Avenue. *[Identical to Improvement Number 2.]*

**Improvement No. 32**      **Cypress Avenue** – Consistent with City of Fontana Circulation Master Plan, construct Cypress Avenue from Slover Avenue to Valley Boulevard over I-10 freeway. This improvement is consistent with City of Fontana Circulation Master Plan. This improvement is identified to provide additional north-south capacity, reducing forecast traffic on Cherry Avenue and Citrus Avenue. This improvement has recently been implemented by the City of Fontana providing the overcrossing connecting Cypress Avenue between Slover Avenue to Valley Boulevard over I-10.

**Improvement No. 33**      **Jurupa Street between Etiwanda Avenue and Mulberry Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway segment to a 6-lane divided roadway segment. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded. *[Identical to Improvement Number 3.]*

**Improvement No. 34**      **Mulberry Avenue between Slover Avenue and Jurupa Street** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment. *[Identical to Improvement Number 4.]*

- Improvement No. 35**      **Country Village Road between Philadelphia Avenue and SR-60 Westbound Ramps** – Consistent with the County of Riverside Circulation Master Plan, widen the study roadway segment from a 4-lane undivided roadway segment to a 6-lane divided roadway segment. Since this improvement is within the jurisdiction of the recently incorporated City of Jurupa Valley, implementation by the City of Fontana cannot be assured. Therefore, this improvement should be included in the planning and collection of fees and coordination with the appropriate lead agency is needed to help administer the improvement.
- Improvement No. 36**      **Jurupa Street between Mulberry Avenue and Cherry Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 4-lane divided roadway to a 6-lane divided roadway. This improvement is included in the City of Fontana 7-year CIP, but is not yet fully funded. *[Identical to Improvement Number 5.]*
- Improvement No. 37**      **San Bernardino Avenue between Cherry Avenue and Fontana Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane divided roadway to a 4-lane divided roadway. Since this improvement is within the jurisdiction of the County of San Bernardino, implementation by the City of Fontana cannot be assured. Therefore, this improvement should be included in the planning and collection of fees and coordination with the appropriate lead agency is needed to help administer the improvement.
- Improvement No. 38**      **Jurupa Street between Cherry Avenue and Citrus Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 5-lane divided roadway to a 6-lane divided roadway. A portion of this improvement has recently been implemented by the City of Fontana providing the capacity for a 6-lane roadway between Poplar Avenue and Citrus Avenue.
- Improvement No. 39**      **Beech Avenue between Slover Avenue and Jurupa Street** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane divided roadway to a 4-lane divided roadway. *[Identical to Improvement Number 6.]*
- Improvement No. 40**      **Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment. *[Identical to Improvement Number 7.]*
- Improvement No. 41**      **Citrus Avenue between Santa Ana Avenue and Jurupa Street** – Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 2-lane undivided roadway segment to a 4-lane undivided roadway segment. *[Identical to Improvement Number 8.]*

**Improvement No. 42**      **Jurupa Street between Citrus Avenue and Sierra Avenue –** Consistent with the City of Fontana Circulation Master Plan, widen the study roadway segment from a 5-lane divided roadway to a 6-lane divided roadway. This improvement has recently been implemented by the City of Fontana providing the capacity for a 6-lane roadway between Citrus Avenue and Sierra Avenue.

The following improvements are identified to achieve acceptable operations at the affected study intersections for forecast year 2030 with project conditions assuming implementation of the identified roadway segment improvements:

**Improvement No. 43**      **I-15 Southbound Ramps/Jurupa Street –** Widen the southbound I-15 Southbound Off-Ramp from one left-turn lane, one shared left-turn/through/right-turn lane, and one right-turn lane to consist of two left-turn lanes, one through lane, and one right-turn lane.

**Improvement No. 44**      **Etiwanda Avenue/San Bernardino Avenue –** Widen the northbound Etiwanda Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound San Bernardino Avenue approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes. Additionally, modify the westbound San Bernardino Avenue signal phasing to include a westbound right-turn overlap, which will preclude U-turn movement from southbound to northbound Etiwanda Avenue. *(This recommended improvement is consistent with Improvement No. 9.)*

**Improvement No. 45**      **Etiwanda Avenue/East Airport Drive-Slover Avenue –** Widen the northbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and one shared through/right-turn lane. Widen the southbound Etiwanda Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the eastbound East Airport Drive approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes. *(This recommended improvement is consistent with Improvement No. 10.)*

**Improvement No. 46**      **Etiwanda Avenue/Jurupa Street –** Widen the eastbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through

lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, four through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 11.)*

**Improvement No. 47**

**Commerce Way/Ontario Mills Parkway** – Widen the northbound Commerce Way approach from two left-turn lanes, one through lane, and one right-turn lane.

**Improvement No. 48**

**Mulberry Avenue/Slover Avenue** – In concert with construction of the extension of Mulberry Avenue north of Slover Avenue, widen the northbound Mulberry Avenue approach from one left-turn lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Construct and stripe the southbound Mulberry Avenue approach to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from two through lanes and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane and two through lanes to consist of one left-turn lane, three through lanes, and one right-turn lane. Additionally, modify the signal phasing to consist of protected left-turn phasing. *(This recommended improvement is consistent with Improvement No. 12.)*

**Improvement No. 49**

**Mulberry Avenue/Santa Ana Avenue** – Widen the northbound Mulberry Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Re-stripe the eastbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the westbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Additionally, modify the east-west signal phasing from permitted left-turns to protected left-turns. *(This recommended improvement is identical to Improvement No. 13.)*

**Improvement No. 50**

**Mulberry Avenue/Jurupa Street** – Modify the northbound Mulberry Avenue signal phasing to include a northbound right-turn overlap, which will preclude U-turn movement from westbound to eastbound Jurupa Street. Widen the southbound Mulberry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Additionally, modify the southbound Mulberry Avenue signal phasing to include a southbound right-turn overlap, which will preclude U-turn movement from eastbound to westbound Jurupa Avenue. Widen

the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Jurupa Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 14.)*

**Improvement No. 51**

**Banana Avenue/Valley Boulevard** – Signalize the Banana Avenue/Valley Boulevard intersection. According to the City of Fontana, the Banana Avenue/Valley Boulevard intersection satisfies traffic signal warrants and is in Pre-Construction. *(This improvement is identical to Improvement No. 15.)*

**Improvement No. 52**

**Cherry Avenue/San Bernardino Avenue** – Widen the eastbound San Bernardino Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane.

**Improvement No. 53**

**Cherry Avenue/Valley Boulevard** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and defacto one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Valley Boulevard approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 16.)*

**Improvement No. 54**

**Cherry Avenue/Slover Avenue** – Widen the northbound Cherry Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of two left-turn lanes, five through lanes and one right-turn lane. Widen the southbound Cherry Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and two right-turn lanes. Additionally, modify the southbound Cherry Avenue signal phasing to include a southbound right-turn overlap, which will preclude U-turn movement from eastbound to westbound Slover Avenue. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, two through lanes, and one right-turn lane to consist of one left-turn lane, three through lanes, and two right-turn lanes. Additionally, modify the westbound Slover Avenue signal phasing to include a westbound right-turn overlap, which will preclude U-turn movement from southbound to northbound Cherry Avenue.

*(This recommended improvement is consistent with Improvement No. 17.)*

- Improvement No. 55**      **Cherry Avenue/Santa Ana Avenue** – Widen the southbound Cherry Avenue approach from one left-turn lane, two through lanes, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane.
- Improvement No. 56**      **Cherry Avenue/Jurupa Street** – Widen the northbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the southbound Cherry Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 18.)*
- Improvement No. 57**      **Beech Avenue/Valley Boulevard** – Signalize the Beech Avenue/Valley Boulevard intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, one through lane, and one shared through/right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 19.)*
- Improvement No. 58**      **Beech Avenue/Slover Avenue** – Signalize the Beech Avenue/Slover Avenue intersection. Widen the northbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Beech Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 20.)*
- Improvement No. 59**      **Beech Avenue/Santa Ana Avenue** – Signalize the Beech Avenue/Santa Ana Avenue intersection. *(This recommended improvement is identical to Improvement No. 21.)*

**Improvement No. 60**

**Beech Avenue/Jurupa Street** – Signalize the Beech Avenue/Jurupa Street intersection. Widen the northbound Beech Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of two left-turn lanes, one through lane, and one right-turn lane. Widen the eastbound Jurupa Street approach from one shared left-turn/through lane and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 22.)*

**Improvement No. 61**

**Citrus Avenue/Valley Boulevard** – Widen the northbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the eastbound Valley Boulevard approach from two left-turn lanes, one through lane, and one shared through/right-turn lane to consist of two left-turn lanes, two through lanes, and two right-turn lanes. Additionally, modify the eastbound Valley Boulevard signal phasing to include an eastbound right-turn overlap, which will preclude U-turn movement from northbound to southbound Citrus Avenue. *(This recommended improvement is consistent with Improvement No. 23.)*

**Improvement No. 62**

**Citrus Avenue/Slover Avenue** – Widen the northbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and two right-turn lanes. Widen the eastbound Slover Avenue approach from one left-turn lane, two through lanes, and one defacto right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. *(This recommended improvement is identical to Improvement No. 24.)*

**Improvement No. 63**

**Citrus Avenue/Santa Ana Avenue** – Signalize the Citrus Avenue/Santa Ana Avenue intersection. Widen the northbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Widen the southbound Citrus Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn

lane. Widen the eastbound Santa Ana Avenue approach from one shared left-turn/through/right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. Re-stripe the westbound Santa Ana Avenue approach from one shared left-turn/through lane and one right-turn lane to consist of one left-turn lane and one shared through/right-turn lane. *(This recommended improvement is identical to Improvement No. 25.)*

**Improvement No. 64**

**Citrus Avenue/Jurupa Street** – Signalize the Citrus Avenue/Jurupa Street intersection. Widen the northbound Citrus Avenue approach from one left-turn lane, one through lane, and one right-turn lane to consist of one left-turn lane, two through lanes, and one right-turn lane. Widen the southbound Citrus Avenue approach from one left-turn lane and one shared through/right-turn lane to consist of two left-turn lanes, one through lane, and one shared through/right-turn lane. Widen the eastbound Jurupa Street approach from one left-turn lane, two through lanes, and one shared through/right-turn lane to consist of one left-turn lane, four through lanes, and one right-turn lane. Widen the westbound Jurupa Street approach from one left-turn lane, one through lane, and one shared through/right-turn lane to consist of one left-turn lane, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 26.)*

**Improvement No. 65**

**Sierra Avenue/Slover Avenue** – Widen the eastbound Slover Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, four through lanes, and one right-turn lane. Widen the westbound Slover Avenue approach from two left-turn lanes, two through lanes, and two right-turn lanes to consist of two left-turn lanes, three through lanes, and two right-turn lanes. *(This recommended improvement is consistent with Improvement No. 27.)*

**Improvement No. 66**

**Sierra Avenue/Jurupa Street** – Widen the southbound Sierra Avenue approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lane, two through lanes, and two right-turn lanes. Widen the westbound Jurupa Street approach from two left-turn lanes, two through lanes, and one right-turn lane to consist of two left-turn lanes, three through lanes, and one right-turn lane. *(This recommended improvement is consistent with Improvement No. 28.)*

**Improvement No. 67**

**Armstrong Road/SR-60 Eastbound Ramps** – Contribute towards preparation of a Project Study Report to improve operations, circulation, and access at the Armstrong Road/SR-60 interchange. *(This intersection improvement is identical to Improvement No. 29.)*

## **CIRCULATION CONSIDERATIONS**

As requested, discussion has been provided regarding potential circulation improvements that require a high level of coordination with other agencies. The three circulation connections discussed below consist of:

1. Extension of Santa Ana Avenue just east of Live Oak Avenue over Union Pacific Railroad;
2. Northeast corner widening at Etiwanda Avenue at Philadelphia Street; and
3. Extension of Philadelphia Street across San Sevaire Flood Control Channel.

Improvements or extension of the facilities identified above would require coordination with Union Pacific Railroad, the County of San Bernardino, and the County of Riverside.

### **Santa Ana Avenue Circulation**

Santa Ana Avenue is discontinuous between Live Oak Avenue and Hemlock Avenue at the Union Pacific Railroad (UPRR) which is oriented in a north-south direction. In the past, the City of Fontana has worked connecting Santa Ana Avenue across the railroad, however, easements to extend the street haven't been acquired, and the extension has remained outstanding. Extension of Santa Ana Avenue would provide improved capacity for east/west motorists, alleviating potential demand on parallel roadways such as Jurupa Avenue and Slover Avenue.

The SWIP project traffic analysis did not identify the need for circulation improvements to Slover Avenue beyond the currently constructed roadway cross-section. However, the SWIP project traffic analysis identified the need to widen Jurupa Avenue consistent with the City of Fontana General Plan Circulation Element. Since the extension of Santa Ana Avenue across the UPRR only provides minor improvement to east/west traffic operations, it is recommended the extension be considered again at a future date as appropriate.

### **Etiwanda Avenue/Philadelphia Street Intersection**

Widening of the eastbound Philadelphia Street approach at the Etiwanda Avenue/Philadelphia Street intersection is limited due to the north/south UPRR crossing of Philadelphia Street on the east leg of the intersection. While Philadelphia Street is widened to ultimate cross-section west of the Etiwanda Avenue/Philadelphia Street intersection, the east leg of the intersection operates as a two-lane undivided roadway with a westbound left-turn lane at the intersection. Additional easements to enlarge the UPRR crossing, and to obtain right-of-way from the privately owned property at the northeast corner of the Etiwanda Avenue/Philadelphia Street intersection, would provide the opportunity to enhance intersection operations with additional east/west through lanes, or an additional westbound right-turn lane. Provision of a westbound right-turn lane would improve operations while large vehicles maneuver from Philadelphia Street to Etiwanda Avenue, without potentially encroaching into the adjacent lane.

The SWIP project traffic analysis did not identify the need for circulation improvements to the Etiwanda Avenue/Philadelphia Street intersection beyond the currently constructed intersection. Since no additional improvements are required at the Etiwanda Avenue/Philadelphia Street intersection to implement the SWIP project, it is recommended the widening of the westbound approach be considered again at a future date as appropriate.

## **Philadelphia Street Circulation**

Philadelphia Street is discontinuous between Etiwanda Avenue and Mulberry Avenue at the San Sevaine Flood Control Channel (SSFCC) which is oriented in a north-south direction. In the past, the City of Fontana has discussed connecting Philadelphia Street across the channel, however, concerns regarding potential through traffic, including heavy trucks adjacent the residential community south of Philadelphia Street, have limited resolution of the matter. Extension of Philadelphia Street would provide improved capacity for east/west motorists, alleviating potential demand on parallel roadways such as Marlay Avenue, San Sevaine Way, and State Route 60 (SR-60). Philadelphia Street provides the boundary between the City of Fontana and the County of Riverside. South of Philadelphia Street, Mulberry Avenue changes names within the County of Riverside to Country Village Road. Country Village Road provides a full-access interchange at SR-60, while the Etiwanda Avenue interchange providing access to SR-60 to and from the east due to restrictions from the UPRR which trends in a northwest/southeast direction. Motorists from the City of Fontana traveling to westbound SR-60 must proceed to Mission Boulevard to access the westbound direct ramps. Since operations at the Country Village Road/SR-60 interchange are not limited by rail, the Country Village Road/SR-60 interchange may appear more attractive to motorists within the City of Fontana.

The SWIP project traffic analysis did not identify the need for circulation improvements to arterials in the vicinity of the discontinuity in Philadelphia Street beyond applicable General Plan Circulation Elements. While the connection of the two discontinuous Philadelphia Street segments at the SSFCC could help facilitate east/west traffic operations, the connectivity gain may be contrasted by potential effects on the nearby residential neighborhood. Therefore, it is recommended the extension be considered at a future date as appropriate.

## **CONCLUSIONS**

When accounting for displaced land uses, the proposed project is forecast to generate approximately 219,929 net new daily trips, which include approximately 21,091 a.m. net new peak hour trips and approximately 22,880 p.m. net new peak hour trips.

Since the collection of baseline traffic data for this analysis, improvements have been implemented at the following locations:

- Cypress Avenue overcrossing providing vehicular connectivity between Slover Avenue and Valley Boulevard over I-10;
- Sierra Avenue/Jurupa Street intersection improvements; and
- Jurupa Avenue widening to a 6-lane roadway between Sierra Avenue to Poplar Avenue with traffic signals at Sierra Avenue, Cypress Avenue, Citrus Avenue, and Poplar Avenue.

Both the Cherry Avenue/I-10 and the Citrus Avenue/I-10 interchanges are in construction phase as of September 2011, with completion of construction anticipated in the year 2013.

Improvements are identified at the following roadway segments to achieve acceptable operations at the deficient roadway segments for forecast existing with project conditions:

- Mulberry Avenue;
- Beech Avenue;

- Jurupa Street between Etiwanda Avenue and Mulberry Avenue;
- Mulberry Avenue between Slover Avenue and Jurupa Street;
- Jurupa Street between Mulberry Avenue and Cherry Avenue;
- Beech Avenue between Slover Avenue and Jurupa Avenue;
- Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue; and
- Citrus Avenue between Santa Ana Avenue and Jurupa Street.

Improvements are identified at the following study intersections to achieve acceptable operations at the deficient intersections for forecast existing with project conditions:

- Etiwanda Avenue/San Bernardino Avenue;
- Etiwanda Avenue/East Airport Drive-Slover Avenue;
- Etiwanda Avenue/Jurupa Street;
- Mulberry Avenue/Slover Avenue;
- Mulberry Avenue/Santa Ana Avenue;
- Mulberry Avenue/Jurupa Street;
- Banana Avenue/Valley Boulevard;
- Cherry Avenue/Valley Boulevard;
- Cherry Avenue/Slover Avenue;
- Cherry Avenue/Jurupa Street;
- Beech Avenue/Valley Boulevard;
- Beech Avenue/Slover Avenue;
- Beech Avenue/Santa Ana Avenue;
- Beech Avenue/Jurupa Street;
- Citrus Avenue/Valley Boulevard;
- Citrus Avenue/Slover Avenue;
- Citrus Avenue/Santa Ana Avenue;
- Citrus Avenue/Jurupa Street;
- Sierra Avenue/Slover Avenue;
- Sierra Avenue/Jurupa Street; and
- Armstrong Road/SR-60 Eastbound Ramps.

Roadway segment improvements are identified at the following roadway segments to achieve acceptable operations at the deficient roadway segments for forecast year 2030 with project conditions:

- Mulberry Avenue;
- Beech Avenue;

- Cypress Avenue;
- Jurupa Street between Etiwanda Avenue and Mulberry Avenue;
- Mulberry Avenue between Slover Avenue and Jurupa Street;
- Country Village Road between Philadelphia Avenue and SR-60 Westbound Ramps;
- Jurupa Street between Mulberry Avenue and Cherry Avenue;
- San Bernardino Avenue between Cherry Avenue and Fontana Avenue;
- Jurupa Street between Cherry Avenue and Citrus Avenue;
- Beech Avenue between Slover Avenue and Jurupa Street;
- Citrus Avenue between I-10 Eastbound Ramps and Santa Ana Avenue;
- Citrus Avenue between Santa Ana Avenue and Jurupa Street; and
- Jurupa Street between Citrus Avenue and Sierra Avenue.

Improvements are identified at the following study intersections to achieve acceptable operations at the deficient intersections for forecast year 2030 with project conditions:

- I-15 Southbound Ramps/Jurupa Street;
- Etiwanda Avenue/San Bernardino Avenue;
- Etiwanda Avenue/East Airport Drive-Slover Avenue;
- Etiwanda Avenue/Jurupa Street;
- Commerce Way/Ontario Mills Parkway;
- Mulberry Avenue/Slover Avenue;
- Mulberry Avenue/Santa Ana Avenue;
- Mulberry Avenue/Jurupa Street;
- Banana Avenue/Valley Boulevard;
- Cherry Avenue/San Bernardino Avenue;
- Cherry Avenue/Valley Boulevard;
- Cherry Avenue/Slover Avenue;
- Cherry Avenue/Santa Ana Avenue;
- Cherry Avenue/Jurupa Street;
- Beech Avenue/Valley Boulevard;
- Beech Avenue/Slover Avenue;
- Beech Avenue/Santa Ana Avenue;
- Beech Avenue/Jurupa Street;
- Citrus Avenue/Valley Boulevard;
- Citrus Avenue/Slover Avenue;

- Citrus Avenue/Santa Ana Avenue;
- Citrus Avenue/Jurupa Street;
- Sierra Avenue/Slover Avenue;
- Sierra Avenue/Jurupa Street; and
- Armstrong Road/SR-60 Eastbound Ramps.
